CERTIFIED MAIL

Dear Sir:

With regard to:

TSCA Section 8(e) submission on: Elemental Phosphorus

Submitted by: Monsanto Company (on behalf of the Ad-Hoc Committee of Phosphorus Manufacturers)

Date submitted: August 24, 1989

EPA Document Control Number: SEHQ-0889-0820 ✓

"For Your Information" Notice on: Elemental Phosphorus

Submitted by: Monsanto Company

Date submitted: June 11, 1985

EPA Document Control Number: FVI-OTS-0785-0423

The Office of Toxic Substances (OTS) has completed a preliminary evaluation of the above referenced TSCA Section 8(e) and "For Your Information" (FYI) submissions concerning elemental phosphorus. The enclosed status report is the result of that preliminary OTS evaluation but does not necessarily represent EPA's conclusion on this chemical substance. EPA asks that you ensure that a copy of the enclosed status report is forwarded to each company on whose behalf the above referenced Section 8(e) notice was submitted.

In order for the Agency to evaluate the overall significance of the reported toxicologic findings, please submit complete copies of the final reports (including the actual experimental protocols, results of gross/histopathological examinations, results of any statistical analyses, etc.); from the one-generation reproduction studies cited in the above referenced Section 8(e) and FYI submissions.

Regarding the referenced FYI notice, it is EPA's initial position that the parturition-related toxic effects described therein should have been submitted under Section 8(e) of TSCA. The basis for this Agency position on the Section 8(e)-applicability/reportability of the subject findings can be found in the COMMENTS/RECOMMENDATIONS section of the enclosed status report. Considering EPA's position in this matter, Monsanto is asked to provide (within 20 working days) its rationale as to why the toxicologic information contained in FYI-OTS-0785-0423 was not submitted to EPA under Section 8(e) of TSCA.

In view of EPA's general interest in corporate actions that are taken on a voluntary basis in response to chemical toxicity or exposure data, please describe the actions that Monsanto and other members of the "Ad-Hoc Committee of Phosphorus Manufacturers" have taken or plan to take 1) to notify workers and others about the reported toxicological findings, and 2) to reduce or eliminate the exposure to elemental phosphorus. In addition, please describe the nature and results, if available, of all studies (other than those submitted already to EPA or those published in the open scientific literature) about which Monsanto and the other "Ad-Hoc Committee" member companies are aware or that Monsanto or those companies have conducted, are conducting, or plan to conduct that are designed to determine the toxicity of or the exposure to elemental phosphorus.

In responding to this request for information, or in otherwise communicating with EPA about the referenced TSCA Section 8(e) and FYI submissions, please refer to the respective Document Control Numbers assigned to those submissions. As in the case of initial FYI and TSCA Section 8(e) submissions, all responses/correspondence will be placed in the Agency's public files unless confidentiality is claimed according to the procedures outlined in Part X of EPA's TSCA Section 8(e) policy statement ("Statement of Interpretation and Enforcement Policy; Notification of Substantial Risk" 43 FR 11110; March 16, 1978). Any claims for confidentiality should be supported by submission of information as described in the enclosed item entitled "Support Information for Confidentiality Claims."

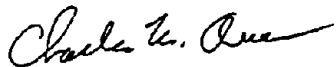

Unless specified otherwise, all available information requested by my letter should be transmitted to the Office of Toxic Substances (OTS) Document Processing Center at the following address within 20 working days of your receipt of my letter; any requested information or supplemental information that may become available after your response to my letter should be sent to the Agency immediately upon receipt of such information.

Document Processing Center (TS-790)  
(Attn: Section 8(e) Coordinator)  
Office of Toxic Substances  
U.S. Environmental Protection Agency  
401 "M" Street, S.W.  
Washington, D.C. 20460

Should you have any questions or comments prior to responding to EPA's request for information, please contact Mr. Frank D. Kover, Chief, Chemical Screening Branch/ECAD at (202)-382-3436.

The U.S. Environmental Protection Agency looks forward to continued cooperation with Monsanto and the other corporate members of the "Ad-Hoc Committee of Phosphorus Manufacturers" in ongoing efforts to evaluate and minimize the potential risks posed by chemicals to health or the environment.

Sincerely,

Charles M. Auer  
Acting Director  
Existing Chemical  
Assessment Division

Existing Chemical Assessment Division/OTS

SUBMISSION DESCRIPTION

On behalf of the "Ad-Hoc Committee of Phosphorus Manufacturers," the Monsanto Company submitted preliminary findings from a one-generation rat reproduction study of elemental phosphorus (CAS No. 7723-14-0). (The Committee's member companies, who manufacture, import or distribute elemental phosphorus in the U.S., are listed on the last page (Page 9) of this status report.) In its TSCA Section 8(e) submission (SEHQ-0889-0820 INIT), Monsanto provided the following summary information about the conduct and preliminary results of this one-generation reproduction study:

"In this study, elemental phosphorus was administered by gavage in either corn oil or tricaprylin at a dose level of 0.075 mg/kg/day to rats 100 days prior to mating, through mating, and either through day 15 of gestation or throughout gestation. The preliminary results show the occurrence of deaths in treated dams during the last two days of gestation and during parturition. A similar effect was seen in rats dosed throughout gestation and those withdrawn from treatment after gestation day 15."

<sup>1</sup> This status report is the result of a preliminary evaluation of information that has been submitted to EPA under Section 8(e), the "substantial risk" information reporting provision of the Toxic Substances Control Act (TSCA), as well as on a "For Your Information" (FYI) basis. The statements made in this status report should not be regarded as expressing final Agency policy or intent with respect to the subject chemical. Any review of this status report should take into account that the report may be based on incomplete information.

In a supplemental Section 8(e) notice (8EHQ-0889-0820 SUPP), the FMC Corporation stated that FMC concurred in Monsanto's submission of the subject information to EPA under Section 8(e) of TSCA.

It should be noted that the Agency previously received a "For Your Information" (FYI) notice (FYI-OTS-0785-0423) in which the Monsanto Company submitted the following summary information with regard to the conduct and results of a one-generation reproduction study of elemental phosphorus in rats:

**"Methods**

"Elemental yellow phosphorus (Elemental P) in corn oil was administered by gavage to three groups of 15 male and 30 female 8 week-old Sprague-Dawley derived . . . rats at dosage levels of 0.005, 0.015, [or] 0.075 mg/Kg/day. All [of the] animals received a constant volume of corn oil, 5.0 ml/Kg/day. Treatment began 80 days prior to mating and continued throughout mating, gestation and lactation periods. A control group of 15 males and 30 female rats received the vehicle, corn oil, and a comparable regimen. While this study was originally designed to be a one-litter, one-generation reproduction study, because of low fertility in all groups in the first litter, the study was extended to a two-litter, one-generation study. [The] dosing was continued between the two mating periods. All adult and weaning animals were observed for mortality and clinical signs of toxicity twice daily. Detailed physical examinations were performed weekly. Male body weights were recorded weekly. Female body weights were recorded weekly and on days 0, 6, 13 and 20 of gestation, [and] on days 0, 4, 14, and 21 of lactation. Adult food consumption was measured weekly except during mating for males and females. Females were smeared for ten days prior to mating to establish estrous cycle. Smearing was continued until evidence of copulation [was] observed. Pups were examined twice daily and counted on days 0, 4, 14 and 21 of lactation. [The] individual pup weights were recorded on days 0, 4, 14 and 21 of lactation.

"All [of the] pups were sacrificed at weaning while the parental animals were sacrificed after weaning of [the] F<sub>1</sub>b litter. Complete post-mortem examinations were performed on 10 F<sub>0</sub> parental males per group, all F<sub>0</sub> parental females, all F<sub>0</sub> females which did not deliver litters, 10 F<sub>1</sub>b pups per sex per group, 5 F<sub>1</sub>a pups per sex per group and all animals that died on study or were killed in a moribund condition. All other animals were examined externally, sacrificed by carbon dioxide asphyxiation and discarded. . . .

"Results"

"The incidence of mortality among control, low, mid and high level male rats was 1, 2, 0 and 0, respectively. These deaths were not considered to be related to [the] administration of test compound. Mortality among female rats was 4, 1, 1 and 16 for the control, low, mid- and high dosage groups, respectively. While the exact cause of deaths in the high dosage group is not known (except for one female which died of rupture of uterine walls), these deaths are considered to be related to difficulty at parturition because seven females died on gestation day 21 or 22 after F<sub>1</sub>a mating and six females died on the last two days of gestation after F<sub>1</sub>b matings. There was no evidence of difficulty in giving birth in the 0.015 and 0.005 mg/Kg dosage groups. There were no apparent clinical signs of toxicity among animals treated with Elemental P except for hair loss on both forelimbs in the 0.075 mg/Kg/day dosage group.

"Mean body weights for F<sub>0</sub> males in the low and mid-dosage group, while not statistically different, were slightly lower than controls throughout the study. In the high dosage group, mean body weights of male rats were comparable to controls for the first part of the study (15 weeks) but appeared to be lower than controls for the latter part of the study. However, there was no dose-related decrease and thus the significance of these changes is unknown. Mean body weights in females treated with Elemental P were considered to be comparable to controls. F<sub>0</sub> mean body weights of treated females were comparable to controls during gestation and lactation for both litters. [The] food consumption data for treated rats were also comparable to controls throughout the study.

"While there was no significant difference in male and female fertility indices in the control and treated groups, the fertility index for male and female [rats] in all groups for the F<sub>1</sub>a mating was low. The lowest values [observed] occurred in the control group; the male and female fertility index in the control group 73.3 and 60.0, respectively. These values were just outside the historical range at . . . [the testing laboratory]. Thus a decision was made to mate the parental animals for one more litter. Male and female fertility indices of treated animals for the F<sub>1</sub>b matings were comparable to controls. Estrous cycle determined prior to F<sub>1</sub>a and F<sub>1</sub>b matings showed occasional irregularities (prolonged estrous and post-estrous) at equal frequencies in control and treated groups. The mean length of gestation in the treated groups was comparable to controls.

"Mean number of viable pups in the F<sub>1</sub>a litter at 0.075 mg/Kg/day were slightly lower than controls, but this change was not statistically significant. There was a concomitant slight increase in the mean number of dead pups in the F<sub>1</sub>a litter. [A] similar trend was also observed in the F<sub>1</sub>b litter. Mean numbers of viable and dead pups in the low and mid-dosage level animals for both the F<sub>1</sub>a and F<sub>1</sub>b litters were comparable to controls. Pup survival through weaning for both F<sub>1</sub>a and F<sub>1</sub>b litters for all treated groups was comparable to controls.

"Mean pup weights at birth and throughout lactation were comparable to controls. The appearance and behavior of pups at birth and throughout lactation was not adversely affected by treatment with Elemental P.

"There were no compound-related gross changes at necropsy of the F<sub>0</sub>, F<sub>1</sub>a or F<sub>1</sub>b generations. There were no compound-related microscopic changes [observed] in the F<sub>0</sub> and F<sub>1</sub>b generations.

#### Conclusions

"[The] administration of Elemental P at a dosage level of 0.075 mg/Kg/day adversely affected parturition for both litters. Mean number of live pups was also slightly reduced in the 0.075 mg/Kg/day dosage group. The no-observable-adverse-effect-level [(i.e., NOAEL)] in this study was considered to be 0.015 mg/Kg/day."

In submitting the preceding information to EPA on an FYI basis, Monsanto noted that "while certain toxic effects of exposure to phosphorus are well known," the adverse parturition-related effect described in the submitted report may not be well known. Monsanto also acknowledged the fact that "difficulty at parturition is an infrequently observed event in rat reproduction studies." Further, Monsanto stated specifically that the "administration of 0.075 mg/Kg/day of elemental phosphorus in corn oil to rats for 80 days prior to mating, during mating and gestation was considered to have resulted in difficulty in delivery, so much so that 13 females in this group died on gestation days 21 or 22 (seven females during generation of a first litter and six females during generation of a second litter)." Monsanto also presented the following hypothesis with regard to the influence that the corn oil vehicle may have exerted on phosphorus bioavailability during the study:

"The corn oil vehicle used to prevent reaction of the phosphorus with gastric juices and intestinal fluids probably influenced the tissue bioavailability of [the] phosphorus. It may not only have protected phosphorus from degradation to phosphate ion, but may have permitted relatively small amounts of phosphorus to have direct access to cells."

In conclusion, Monsanto offered the following information regarding the significance of the findings reported to EPA on an FYI basis, rather than under Section 8(e), the "substantial risk" information reporting provision of the Toxic Substances Control Act (TSCA):

"This information does not indicate that [elemental] yellow phosphorus presents a substantial risk of injury to health of the environment because it is extremely unlikely that anyone would ingest phosphorus at levels sufficiently high to result in adverse effects."

SUBMISSION EVALUATION

TSCA Section 8(e) Submission

Based on a preliminary evaluation of Monsanto's TSCA Section 8(e) submission, which consists of a brief written summary and some data tables, the performed one-generation reproduction study provides evidence of the maternal and developmental toxicity of elemental phosphorus. In this study, elemental phosphorus was tested at a single dosage level of 0.075 mg/kg/day in corn oil or tricaprylin as follows:

<u>Group</u>	<u>Vehicle</u>	<u>Phosphorus</u>	<u>Duration of Treatment</u>
1	corn oil	0	throughout gestation
2	corn oil	0.075 mg/kg	throughout gestation
3	corn oil	0.075 mg/kg	until day 15 of gestation
4	tricaprylin	0	throughout gestation
5	tricaprylin	0.075 mg/kg	throughout gestation

Although the submitted summary provides no evidence that there was a treatment-related effect on male fertility, female fertility was found to be slightly reduced in all phosphorus-treated groups (the pregnancy rate was ~8-10% less than controls). The most significant finding was increased mortality of dams during the last few days of pregnancy and during parturition. The increased mortality was observed in those groups receiving phosphorus in either corn oil or tricaprylin throughout gestation, as well as in the single group in which treatment with phosphorus in corn oil was stopped on day 15 of gestation. In group 2, 6 dams died on gestation day 21, 1 on day 22, and 1 on day 23. In group 3, 5 dams died on day 21 and 3 on day 22. In group 5, 4 dams died on day 21 and 2 on day 22. No parturition-related deaths occurred in either the corn oil or

tricaprylin control groups. In this study, there was also some evidence of developmental toxicity in that the mean litter sizes of the phosphorus-treated groups were found to be slightly reduced compared to their respective control groups. The mean litter sizes for test groups 2 and 3 were 9.7 and 11.7, respectively, while the litter size in the corn oil control group (group 1) was 12.8; the mean litter size of group 5 was 11.8, while litter size in the tricaprylin control group (group 4) was 12.9. At the time that Monsanto submitted the preliminary report to the Agency, this one-generation reproduction study was still in the lactation period of the F<sub>1</sub> pups and further information about the pup body weights and pup survival was not yet available.

FYI Submission

In the FYI submission, Monsanto provided summary results of a one-generation rat reproduction study of elemental phosphorus. This FYI submission consisted only of a cover letter and a short summary report of the study; none of the actual data were provided. In this previous study, elemental phosphorus was administered to rats by gavage at doses of 0, 0.005, 0.015, or 0.075 mg/kg/day in corn oil. According to the summary, there were no effects on male or female fertility, or on body weight, and there were apparently no clinical signs of toxicity. However, in the high-dose group (0.075 mg/kg/day), there was an increase in mortality of dams prior to or during parturition. This is the same result as that obtained in the study cited in Monsanto's current Section 8(e) submission. The FYI submission summary also states that the litter size was slightly reduced in the high-dose group (again, a similar result to that reported in the current Section 8(e) submission), but that pup weight, survival, appearance and behavior of treated pups were found to be comparable to controls.

Overall Evaluation

The individual Section 8(e) and FYI submissions provide evidence that very low exposures to elemental phosphorus (0.075 mg/kg/day) can have a deleterious effect on dam survival just prior to and during parturition. The biological explanation for this serious adverse effect is not at all clear. Parturition is a very complex sequence of events, requiring accurate biological timing. From the summary information presented in Monsanto's Section 8(e) and FYI submissions, the observed parturition failure could be interpreted as being maternal or fetal in origin, and/or could represent maternal hormonal imbalance or other factors or fetal deficit, including death.

In order for EPA to attempt to evaluate the overall significance of the reported toxicologic findings, Monsanto should be asked to submit complete copies of the final reports from the reproduction studies cited in the company's Section 8(e) and FYI submissions. In addition, it would be of interest to know why this particular type of toxicologic study was conducted with elemental phosphorus.

CURRENT PRODUCTION AND USE

A review of the production range (includes importation volumes) statistics for phosphorus (CAS No. 7723-14-0), which is listed in the initial TSCA Inventory, showed that about 380 million to 1.76 billion pounds were reported as produced/imported in 1977. This production range information does not include any data claimed to be TSCA Confidential Business Information (CBI) by the person(s) who reported for the TSCA Inventory, nor does it include any data that would compromise TSCA CBI. All data reported for the initial TSCA Inventory, including the production range data, are subject to the limitations contained in the TSCA Inventory Reporting Regulations (40 CFR 710).

Monsanto did not provide any information on the use(s) of elemental phosphorus; secondary literature references revealed that elemental phosphorus is used in rodenticides, smoke screens and analytical chemistry (gas analysis).

COMMENTS/RECOMMENDATIONS

All members of the "Ad-Hoc Committee of Phosphorus Manufacturers" reportedly received a copy of Monsanto's Section 8(e) submission.

Following a preliminary review of FYI-OTS-0785-0423, it is EPA's initial position that the parturition-related maternal toxicity findings presented therein should have been submitted to the Agency under Section 8(e), the "substantial risk" information reporting provision of the Toxic Substances Control Act (TSCA). The basis for EPA's position in this matter is as follows:

Section 8(e) states that "any person who manufactures, [imports,] processes or distributes in commerce a chemical substance or mixture and who obtains information which reasonably supports the conclusion that such substance or mixture presents a substantial risk of injury to health or the environment shall immediately inform the [EPA] Administrator of such information unless such person has actual knowledge that the Administrator has been adequately informed of such information."

The preface to Part V of EPA's TSCA Section 8(e) policy statement explains that a "substantial risk of injury to health . . . is a risk of considerable concern because of (a) the seriousness of the effect . . . and (b) the fact or probability of its occurrence." With regard to the seriousness of the effect, Part V states that EPA considers the types of health effects for which substantial risk information must be reported to include "any pattern of effects or evidence that the [tested] chemical substance or mixture can produce . . . birth defects or toxic effects resulting in death, or serious or prolonged incapacitation [Part V(a)(2)]." The information regarding

these effects can be obtained directly or inferred from designed tests (e.g., studies in animals) as described in Part VI of the TSCA Section 8(e) policy statement. Part VI explains also that a "person is not to delay reporting until he obtains conclusive information that a substantial risk exists, but is to immediately report any evidence that reasonably supports that conclusion."

With regard to the "fact or probability of its [(i.e., the serious effect's)] occurrence" criterion, Part V of the Section 8(e) policy statement explains that certain types of adverse health effects (e.g., those described in Part V(a)(2) of the policy statement) are considered by EPA to be so serious that relatively little or weight should be attached to the subject chemical exposure in determining whether a risk is substantial. Further, EPA's response to Comment 31 in Appendix B of the Section 8(e) policy statement, as it pertains to a question on R&D chemicals, states that the occurrence of serious effects such as those described in Part V(a)(1) or (2) of the policy statement presuppose exposure to the tested chemical and must be reported immediately to EPA under Section 8(e).

Considering the preceding discussion, EPA believes that the serious parturition-related toxicity data contained in FYI-OTS-0785-0423 offer reasonable support for a conclusion of substantial risk and as such should have been submitted under Section 8(e) of TSCA.

- a) The Existing Chemical Assessment Division will provide the Monsanto Company ample opportunity (20 working days) to rebut EPA's initial position on the TSCA Section 8(e)-applicability/reportability of the information contained in the company's FYI submission.

The Chemical Screening Branch will also ask Monsanto to ensure that EPA receives a full copy of the final report (including the actual experimental protocol, results of gross and histopathological examinations, results of any statistical analyses, etc.) from the one-generation rat reproduction studies cited in the company's TSCA Section 8(e) and FYI submissions. In addition, Monsanto will be asked to provide the specific rationale for the conduct of such studies on elemental phosphorus.

In view of EPA's general interest in company actions that are taken on a voluntary basis in response to chemical toxicity and/or exposure data, Monsanto will be requested to describe the actions that Monsanto and other members of the "Ad-Hoc Committee of Phosphorus Manufacturers" have taken or plan to take 1) to notify workers/others about the reported toxicological findings, and 2) to reduce or eliminate exposure to elemental phosphorus. Monsanto will be asked also to describe the nature and

results, if available, of all studies (other than those submitted already to EPA or those published in the open scientific literature) about which Monsanto and other "Ad-Hoc Committee" companies are aware or that Monsanto or those companies have conducted, are conducting, or plan to conduct that are designed to determine the toxicity of or the exposure to elemental phosphorus.

- b) The Chemical Screening Branch will review the reported information in order to determine the need for further OTS assessment of elemental phosphorus.
- c) The Chemical Screening Branch will send copies of this status report to NIOSH, OSHA, CPSC, FDA, NTP, OSWER/EPA, OW/EPA, ORD/EPA, OAR/EPA and OPP/OPTS/EPA; in addition, copies of this report will be sent to the Environmental Assistance Division/OTS (formerly the TSCA Assistance Office/OTS) for further distribution.

Dear Sir:

This letter is in response to the Nov. 29, 1989 letter from Mr. Charles M. Auer requesting further information on the elemental phosphorus studies submitted by Monsanto (FYI - OTS - 0785-0423 and 8EQ-0889-0820). The Agency has inquired as to Monsanto's rationale for conducting these studies. Human exposure to elemental phosphorus is carefully controlled because it is widely recognized as a highly toxic and pyrophoric substance. Therefore the first study was undertaken not because of widespread human exposure but because of a literature review which revealed reproductive toxicity in aquatic species at low phosphorus concentrations. We wanted to ascertain if these reproductive effects would also be present in mammalian species.

While the results of the first study were suggestive of toxicity in female rats at the time of delivery, there was some evidence that the results may have been complicated by a reaction between elemental phosphorus and corn oil. Thus the results may have been an artifact of the testing methodology and not indicative of risk to humans. In light of this potential complication and very low human exposure to elemental phosphorus, the results of this study were submitted for informational purposes to the Agency, to customers, and to other producers of this element.

Following the submission to the Agency a research program was undertaken to understand the possible interaction between elemental phosphorus and corn oil and to refine the analytical techniques. A two year research program by Monsanto scientists revealed that such interaction indeed occurs if extreme care is not taken to eliminate air during the preparation and handling of dosing solutions. This research effort led to the development of a testing protocol (Attachment 1) which required extremely meticulous care in all stages of sample preparation and analysis beyond the precautions already in the protocol for the first study. A second study on the reproductive effects of elemental phosphorus was undertaken by a consortium of elemental phosphorus producers, using the revised protocol. The results of the second study confirmed that the effects were related to administration of elemental phosphorus, and these preliminary results were submitted as an 8(e).

We are enclosing the final report from the first study (Attachment 2). The consortium has not yet received the final report for the second study. We will submit it to the Agency promptly after we obtain it from the testing laboratory. The report is anticipated in first quarter of 1990.

2

Mr. Auer's letter also requests information on actions taken to notify workers and others about the toxicological findings and actions taken to reduce exposure. Monsanto determined that the material safety data sheet (MSDS) would be an effective medium for communicating these toxicological findings. Therefore, shortly after receipt of the results from the first study, we incorporated the results into Monsanto's elemental phosphorus MSDS and broadly distributed the revised MSDS. A copy of this MSDS, dated 5/1/86, is enclosed (Attachment 3). Shortly after receipt of the preliminary toxicological results from the second study, Monsanto again modified its elemental phosphorus MSDS to provide additional warnings to female employees. A copy of the revised MSDS was sent to all Monsanto plants which produce or handle elemental phosphorus, to customers and to other producers of elemental phosphorus. The MSDS was enclosed with a letter which provided additional information about the study and which outlined Monsanto's exposure limitation practice. This practice is to exclude women of childbearing potential from workplace areas where airborne concentrations on an 8-hour time-weighted average may exceed 0.01mg/m<sup>3</sup>. A copy of the letter and the MSDS dated 9/5/89 are also enclosed (Attachment 4).

We also conducted further industrial hygiene monitoring to assure ourselves that employee exposures did not exceed the above target. Personnel monitoring conducted with several employees at each of seven plants representing phosphorus producing and using facilities confirmed that exposures were less than the above target. Further exposure reductions do not appear to be necessary at this time.

As requested in Mr. Auer's letter, we are forwarding copies of EPA's status report to the other members of the industry consortium, along with a copy of Mr. Auer's letter and this response letter. The other companies are requested to respond directly to the Agency on the worker notification, exposure reduction and other studies submission requests in Mr. Auer's letter. No further studies are planned by the consortium.

Sincerely,

J. Ronald Condray

ONE-GENERATION REPRODUCTION STUDY IN RATS  
WITH ELEMENTAL PHOSPHORUS

Submitted to: Monsanto Company

Attention: Rashmi Nair, Ph.D., D.A.B.T.

Date: January, 1989

QUOTE NO.: 3833C

STUDY TITLE: One-Generation Reproduction Study in Rats with Elemental Phosphorus

The facilities of Bio/dynamics, Inc. and this study will be operated/conducted in accordance with the requirements and recommendations of the Animal Welfare Act (P.L. 89-544, as amended by P.L. 91-579 and P.L. 94-279), and other applicable federal, state and local laws, regulations and policies.

SPONSOR: Monsanto Company  
600 N. Lindbergh Boulevard  
St. Louis, Missouri 63167

ATTENTION: Rashmi Nair, Ph.D., D.A.B.T., Product Toxicology Manager

I. PURPOSE:

The objective of this study is to evaluate the effects of elemental phosphorus on the reproductive performance of the CD® rat through one generation. Test article will be administered by gastric intubation daily to male and female rats over an 80 day pre-mating period and throughout the mating period. Mated females will continue on treatment throughout the ensuing gestation and lactation periods through to weaning of the pups. F<sub>0</sub> adult generation animals will continue to be treated until sacrificed.

II. TESTING FACILITY:

This study will be conducted at Bio/dynamics, Inc. located on Mettlers Road (P.O. Box 2360) in East Millstone, New Jersey 08875-2360.

III. PROPOSED STUDY DATES:

Receipt of Test Animals:	*
Initiation of Treatment:	*
Initiation of Mating:	*
First Day 21 Lactation:	*
Sacrifice of F <sub>0</sub> Adults:	
Males:	*
Females:	*

Submission of Audited Draft Report:	*
-------------------------------------	---

IV. STUDY PERSONNEL:

Study Director:	Raymond E. Schroeder, M.S., D.A.B.T.
Project Supervisor:	Ellen Whiting, AALAS, L.A.T.

\*to be determined

EXPERIMENTAL DESIGN:

-3-

<u>Group</u>	<u>Test Article</u>	<u>Vehicle</u>	<u>Treatment<sup>a</sup> Period</u>	<u>Dose Level mg/kg/day</u>	<u>Dose Volume ml/kg/day</u>	<u>No. of Animals (F<sub>1</sub>)</u>
						<u>Males Females</u>
I	None	Corn oil	PM, M, G, L	0	5	15 10
II	Elemental Phosphorus	Corn oil	PM, M, G, L	0.075	5	15 10
III	Elemental Phosphorus	Corn oil	PM, M <sup>b</sup> , G <sup>b</sup>	0.075	5	15 10
IV	None	Tricaprylin	PM, M, G, L	0	2	15 10
V	Elemental Phosphorus	Tricaprylin	PM, M, G, L	0.075	2	15 10

<sup>a</sup> Males will be treated daily through to sacrifice.<sup>b</sup> Once mated (Day 0 of gestation) females will be treated through to Day 15 of gestation. Females will not be treated for the remainder of gestation or during lactation.

Key: PM = Prenatant treatment period

M = Matting period

G = Gestation

L = Lactation

-4-

VII. MATERIALS AND METHODS:

A. Test Article: Elemental Phosphorus  
Supplier: Monsanto Company  
NBP No's.: 3865209-210 (Ngo)  
Description: Colorless, waxy solid  
Storage Conditions: Stored under water in vials. The latter will be refrigerated in a solid metal container.  
Expiration Date: 12/89  
Hazards and Precautionary Procedures: See Monsanto Toxicology Sample Submission Form and MSDS (also Appendix D).  
B. Vehicles:  
1. Corn oil (Mazola®)  
2. Tricaprylin (glycerol trioctanoate)  
Source:  
1. Commercially available  
2. Sigma Chemical Co., St. Louis, MO.  
C. Test Animals (F<sub>0</sub>):  
Species: Rat  
Strain: Crl:CD® (SD) BR (outbred)  
Supplier: Charles River Breeding Laboratories  
Portage, Michigan  
Justification of Species and Strain of the Test System: Generally recognized standard laboratory rat. This strain of rat is commonly used in reproduction studies, and Bio/dynamics has historical control data concerning the reproductive performance of this strain.  
Number of Animals:  
Females - 180 ordered; 150 used on test.  
Males - 95 ordered; 75 used on test.

-5-

VI. MATERIALS AND METHODS:

C. Test Animals ( $F_0$ )-continued:

Age: Males/Females - 6 weeks at receipt; 5-9 weeks at the initiation of treatment.

Equilibration Period: At least 10 days.

Husbandry: Currently-acceptable practices of good animal husbandry will be followed; e.g., Guide for the Care and Use of Laboratory Animals; DHHS Publication No. (NIH) 85-23, Revised 1985.

Housing - individually, except: the first week of acclimation (2/sex/cage); during mating (2 females/male) and lactation (dam with the litter). Animals will be housed in suspended, stainless steel cages with wire mesh floors. On Day 20 of gestation, stainless steel floor pans will be inserted into the cages of mated females to retain the bedding material. These floor pans will be removed on Day 14 of lactation. Throughout the study absorbent cage papers will be placed beneath each section of cages on the animal rack to catch urine and feces. These absorbent rack papers will be changed at least three times weekly along with cleaning of the animal room.

Food - Purina Certified Rodent Chow<sup>2</sup>, No. 5002 (mash form); ad libitum. Each cage will contain a glass feeder jar with a stainless steel lid. Fresh feeders and diet will be provided at least weekly.

Water - via automated water delivery system (Elizabethtown Water Company); ad libitum.

There are no known contaminants in the feed or water which are expected to be capable of interfering with the results of this study.

VI. MATERIALS AND METHODS:

C. Test Animals (F<sub>0</sub>)-continued:

Husbandry-continued:

Bedding Material - Litter Kleen<sup>®</sup> hardwood shavings; provided for each mated female on Day 20 of gestation; fresh bedding will be provided as needed through to Day 14 of lactation.

Environmental Conditions:

Light/Dark Cycle - via automatic timer; 12 hour light/dark cycle (7 A.M. to 7 P.M.).

Temperature - (72 + 5°F); monitored twice daily (morning/afternoon).

Humidity (30-70%) will be monitored once daily (morning).

Temperature and humidity will be maintained within these ranges to the maximum extent possible.

D. Animal Identification:

All F<sub>0</sub> adult generation animals will be identified with a metal ear tag. The animal's ear tag number plus the Bio/dynamics' Project Number will comprise a unique identification number for each animal.

E. Assignment of Animals to Groups:

After at least one week of acclimation, all animals received for this study will be given a detailed examination. The health status of the animal population will be evaluated at that time by the Staff Veterinarian, and unhealthy animals will be killed and discarded.

Prior to initiation of treatment (4-7 days), animals will be sorted into groups so as to equalize as best possible the mean body weights between test groups. A computerized sorting program will be used which sorts animals on the basis of their pre-sort body weight and temporary cage card number.

-7-

VI. MATERIALS AND METHODS-continued:

F. Administration of Test Article:

Route of Administration: Gastric intubation

Justification for Route of Administration:

A previous reproduction study conducted by the oral route showed toxicity. Since this study is, in part, a repeat of this previous work, it is appropriate to use this same route of administration.

Preparation of Dosing Solutions:

A procedure for preparing the dosing solutions (Corn oil - Groups II and III and tricaprylin Group V) is presented in Appendix E. Bottle of dosing solution will be prepared for use on individual days (one bottle/dose group/day). Dosing solutions will be prepared at two week intervals at Bio/dynamics, Inc.

Stability:

Stability of the dosing solutions over the intended use interval will be conducted by Bio/dynamics, Inc. (see Appendix E.).

Accuracy of Preparation:

The analysis of dosing solutions for use in the study to confirm concentration levels of test article with the carrier will be conducted by Bio/dynamics, Inc. (see Appendix E.).

G. Treatment Schedule:

F<sub>0</sub> males and females will be dosed daily for at least 80 days prior to mating. Dosing of the male animals (all groups - Groups I-V) will continue throughout the mating period until sacrifice. Females will be dosed daily during the mating period (Groups I-V) and mated females from Groups I, II, IV and V will continue to be treated during the ensuing gestation and lactation periods until sacrificed. Unmated females will continue to be dosed daily until sacrificed. In Group III females will be dosed during the mating period and once mated through to include Day 15 of gestation. These animals (Group III) will not be dosed for the remainder of the gestation period or during lactation.

VI. MATERIALS AND METHODS:

G. Treatment Schedule-continued:

A constant dose volume of 5ml/kg/day will be used for Groups I-III and 2 ml/kg/day for Groups IV and V. Individual animal dose volumes will be adjusted at each weighing interval during the study with the exception of Day 20 gestation. Females at Day 20 of gestation will be dosed in accords with their gestation Day 14 weight. All animals will be dosed at approximately the same time each day. Control animals (Groups I and IV) will be administered vehicle only (gastric intubation) at a comparable dose volume as treated animals (V Experimental Design, page 3).

Dosing solutions will be provided by Bio/dynamics (Department of Metabolism and Analytical Chemistry) in rubber capped glass bottles. The following procedure will be used for drawing out dosing solutions.

1. The plastic syringe will be filled with Nitrogen gas ( $N_2$ ) to a volume equivalent to the volume of liquid to be drawn out. (Volume to be dosed plus excess to account for volume in the intubation needle).
2. The syringe at this time will be fitted with a 3-4 inch blunted 18 gauge intubation needle.
3. The needle will be inserted thru the rubber cap, the volume of gas in the syringe expelled into the container and the appropriate volume of dosing solution drawn out.
4. The dose will be delivered (gastric incubation) to the animal.
5. The plunger on the syringe will be removed and the syringe flushed with  $N_2$ , and the plunger placed back in the syringe and the volume set for the next dose volume plus a little extra to compensate for displacement in the intubation needle.
6. All syringes will be filled with dosing solutions in a  $N_2$  blanketed air bag.

H. Mating:

One male will be co-housed nightly with the same two females from the same treatment level until a female shows evidence of mating or for 10 consecutive days. Following this interval, all unmated females will be randomly distributed among the sexually active males (males mating during the first 10-day period) in their respective groups for a second period involving 5 nightly intervals of co-housing. Thus, the mating period will be a total of 15 days.

**VI. MATERIALS AND METHODS:****H. Mating-continued:**

Each morning following intervals of co-housing, females will be evaluated for evidence of mating (copulatory plug in the vagina and/or sperm in the vaginal smear). The day evidence of mating is observed will be considered Day 0 of gestation and mated females will be removed from the mating unit and housed individually for the remainder of gestation.

**I. Parturition and Lactation:**

On Day 20 of gestation, each mated female's cage will be fitted with a stainless steel floor pan and bedding material will be provided. Thereafter, examination of individual females for signs of parturition will be made 24 times daily at hourly intervals. The date and time that parturition initiates will be identified as will the time and date that parturition is considered completed. These data will be noted on the individual female litter examination sheets. Formal litter examinations will be conducted twice daily (morning 8:00-10:30 A.M. and afternoon 3:00-5:00 P.M.). The day on which all pups have been delivered within an individual litter will be designated Day 0 of lactation for that female.

Litters will be housed with their respective dams throughout the lactation period.

**Optional Second ( $F_{1b}$ ) Litter:**

The decision to re-mate males and females to produce a second ( $F_{1b}$ ) litter will be determined by the sponsor after reviewing reproductive data for the  $F_{1a}$  litters.

**VII. EXPERIMENTAL EVALUATION (IN-LIFE):****A. General Observations:** **$F_0$  Females:**

During late gestation and parturition intervals animals will be observed for mortality/morbidity hourly over the 24 hour interval. During other intervals of the study, viability checks will be made at least twice daily (morning, afternoon). Animals found dead during intervals after 5:00 p.m. and before 8:30 a.m. will be refrigerated until necropsy can be performed. Observations of pharmacologic and/or toxicologic effects will be made twice daily along with the daily viability checks. A detailed physical in-life evaluation will be performed weekly for each adult generation animal.

-10-

VII. EXPERIMENTAL EVALUATION (IN-LIFE)-continued:

3. Body Weight Determinations:

Body weights for the F<sub>1</sub> adult males and females will be recorded at initiation of treatment (first day of dosing) and weekly thereafter during the pre-mating period. Males will continue to be weighed weekly during the mating and post-mating intervals. Females that mate will be weighed on Days 0, 7, 14 and 20 of gestation, and females that deliver will be weighed on Days 0, 4, 14 and 21 of lactation. Unmated females will be weighed weekly until termination.

C. Food Consumption:

Food consumption will be recorded for the pre-study (post-sorting) interval (designated baseline period) and weekly for the pre-mating treatment period. Food consumption will be recorded for mated females over the Day 0-7, 7-14 and 14-20 gestation interval. Food consumption will not be recorded in the following instances: males during the mating period; females during the mating and lactation intervals; or females during the post-weaning period till sacrifice. Food consumption will be recorded weekly for males during the post-mating period until sacrificed.

D. Litter Evaluations:

Litters will be observed as soon as possible after delivery during the specified morning or afternoon intervals (Sec. I. Parturition and Lactation; Page 9) for the number of live, dead and total pups at birth. Thereafter, litters will be observed twice daily (morning; afternoon) for the presence of dead pups. The latter will be removed from the litter immediately when found. The occurrence of dead pups during lactation will be recorded on the individual female's litter examination sheet.

Pups will be counted in each litter on Days 0, 4, 7, 14 and 21 of lactation. On Day 4 of lactation, each litter with greater than eight pups will be culled to that number with sex distribution equalized (4/sex) when possible.

Each pup will be given a gross physical examination on Days 0, 4, 14 and 21.

Pups will be weighed individually and sexed (external sexing criteria) on Days 0, 4, 7, 14 and 21.

**VIII. POSTMORTEM:****A. F Females:**

1. Females that retain litters to Day 21 of lactation will be sacrificed after the last litter on study is weaned (sponsor decision). All these females will be given a gross postmortem evaluation and uterine implantation scars will be counted. Abnormal tissues will be noted and tissues saved as per Section C, Page 12.
2. Females that experience complete litter mortality will be sacrificed after the last litter on study is weaned (sponsor decision). These females will be given a gross postmortem evaluation and uterine implantation scars counted. Abnormal tissues will be noted and tissues saved as per Section C, Page 12.
3. Mated females that do not deliver a litter will be killed as a group with those females that have weaned litters (sponsor decision). Females will be given a gross postmortem evaluation with particular attention given to the uterus for the presence of implantation sites or scars. Tissues will be saved as per Section C, Page 12.
4. Females that do not mate will be sacrificed as a group with females that have weaned litters (sponsor decision). These females will be given a gross postmortem examination with particular attention given to the uterus for implantation sites or scars. Abnormal tissues will be noted and tissues saved as per Section C, Page 12.
5. Females that die during the study or are killed in a moribund condition will be given a gross postmortem evaluation. Abnormal tissues will be noted and tissues saved as per Section C, Page 12.

**B. F Males:**

Males will be sacrificed after the last  $F_{1a}$  litters have been weaned (sponsor decision). This will provide an opportunity to evaluate the fertility of these males prior to sacrifice. Such animals may be retained to produce a second ( $F_{1b}$ ) litter (sponsor decision - additional cost item).

-12-

VIII. POSTMORTEM-continued:

C. Tissues Saved and Weighed:

The following tissues will be saved for all F<sub>0</sub> adult generation animals (scheduled sacrifice, moribund sacrifice or spontaneous death):

<u>Males</u>	<u>Females</u>
liver	liver
kidneys	kidneys
bone (right femur)	bone (right femur)
heart	heart
testes*	ovaries
epididymides*	uterus
prostate	vagina
seminal vesicles	pituitary
pituitary	gross lesions
gross lesions	

---

\*Testes and epididymides will be fixed in Bouin's Solution prior to permanent storage in 10% neutral buffered formalin.

Organs identified with an \* above will be weighed at necropsy.

D. F<sub>1</sub> Pups:

These pups will be sacrificed on Day 21 of lactation and given a gross external and internal examination. Only abnormal tissues will be saved.

E. Dead Pups:

Dead pups recovered during lactation will be given an external and internal examination, sexed (internal inspection of the gonads) and preserved in 10% neutral buffered formalin.

F. Culled Pups (Day 4):

Sexed by internal inspection of the gonads and discarded.

G. Method of Sacrifice (F<sub>0</sub> Adults and F<sub>1</sub> Pups):

Overdose of ether inhalation.

H. Preservation of Tissues:

10% neutral buffered formalin.

IX. STATISTICAL EVALUATIONS:

Data for test Group II and III will be compared to data for control Group I and data for test Group V will be compared to data for control Group IV.

<u>Parameters Evaluated</u>	<u>Statistical Procedure</u>
Mortality Data	Incidence Data <sup>a</sup>
Weekly Body Weights - Males and Females Pre-Mating Period	Interval Data <sup>b</sup>

two group comparison (Groups IV-V)]

X. REPORT:

A final report will be prepared and will include the following (prior to  
submitting the final report, one copy of an audited draft report will be  
sent to the sponsor):

Abstract  
Introduction  
Materials and Methods  
Experimental Design  
Results and Discussion

X. REPORT-continued:

The following data will be summarized:

Mortality

Mean body weight data; pre-mating treatment period and mean weight gain for the entire interval

Mean body weight data (males); post-mating interval (weekly)

Mean maternal body weight data; gestation/lactation interval

Mean food consumption; each recorded interval

Mating, pregnancy and fertility indices

Summary statement for physical in-life evaluation data and gross postmortem observations

$F_1$  litter data; gestation length, litter size, dead pups at birth, missing pups during lactation

Mean pup weight and sex distribution ratios; each recorded interval

Pup survival indices

Organ weight data ( $F_0$  adults) - absolute and relative to TBW

Appended data will include but not be limited to:

Animal cernimation history

Individual body weight data; all recorded intervals

Individual food consumption data; all recorded intervals

Individual female  $F_1$  litter data to include: gestation length, number of live, dead and total pups at birth and litter size on Days 0, 4, 14 and 21; mean pup weight (each recorded interval) and number of male/female pups each recorded interval

Individual and summarized physical in-life observation data

Individual gross postmortem observation data (Pathology Report) -  $F_0$  adults/ $F_1$  pups

Individual organ weight data - absolute and relative to TBW

Quality Assurance Statement

Personnel Involved in the study

Copy of Protocol

XI. QUALITY ASSURANCE STATEMENT:

This study will be subject to the quality assurance auditing procedures as set forth by the Quality Assurance Unit of Bio/dynamics Inc. This study is designed to conform to the EPA (TSCA) GLP regulations as set forth in 40 CFR, Part 792.

XII. ALTERATION OF DESIGN:

Alterations of this protocol may be made as the study progresses. No changes in the protocol will be made without the specific written request or consent of the sponsor. In the event that the sponsor authorizes a protocol change verbally, such change will be honored by Bio/dynamics which will follow such verbal change with a written verification. All protocol modifications will be signed by the Study Director.

18

Bio/dynamics Inc

-15-

XIII. PRESERVATION OF TEST RECORDS AND SPECIMENS:

At the completion of the study, all reports, raw data, preserved specimens and retained samples will be maintained without charge in the Bio/dynamics Inc. Archives for a period of at least one year after submission of the final report. The sponsor will be notified annually thereafter regarding additional cost for sample space needed to retain raw data/samples beyond one year.

The unused portion of the test material will be returned to the sponsor following completion of the study.

PROTOCOL REVIEWED AND ACCEPTED:

I have reviewed the protocol of the above study and have found that the study design will minimize pain or distress by the test animals within the objectives of the study. If anesthetic, analgesic, or tranquilizer drugs can be used, they are the proper type for the given species. If euthanasia is to be performed, the method is proper for the given species.

## APPENDIX A

## STATISTICAL PROGRAM - MULTIPLE/TWO GROUP STUDIES (INCIDENCE)

---

---

statistical analysis of incidence data will be performed using contingency table techniques, comparing each treated group with the control group. For each such comparison, a 2x2 table will be formed from the numbers of animals with and without the event of interest in both the control and treated group. The table will be evaluated by the Fisher's Exact test. Tests will be conducted at the 1% two-sided risk level.

Reference for this procedure is Bradley, J.V., Distribution Free Statistical Tests, Prentice-Hall, Englewood Cliffs, N.J., 1968, pp. 195-203.

20

## APPENDIX A

MULTIPLE GROUP STUDIES (INCIDENCE)

Statistical analysis of incidence data will be performed using contingency tables. First a standard chi-square analysis will be performed to determine if the proportion of incidences differ between the groups tested. In keeping with standard statistical practice, if any one cell has an expected value less than 5, this step will not be reported. Next, each treatment group will be compared to the control group using a 2x2 Fisher Exact test, the significance level will be corrected via the Bonferroni inequality to assure an overall test of the stated significance level. Thirdly, Armitage's test for linear trend in the dosage groups will be performed.

All tests will be reported at the 5% and 1% level of significance.

References for the techniques are:

- Chi-square: Snedecor, G.W., and Cochran, W.G., Statistical Methods, 6th ed., Iowa State University Press, Ames, Iowa, 1971, pp. 250-253.
- Fisher Exact Test: Bradley, J.V. Distribution Free Statistical Tests, Prentice-Hall, Englewood Cliffs, N.J., 1968, pp. 195-203.
- Bonferroni Inequality: Miller, R.G., Jr., Simultaneous Statistical Inference, McGraw-Hill Book Company, N.J., 1966, pp. 15.
- Armitage's Test: Armitage, P., "Tests for Linear Trends in Proportions and Frequencies", Biometrics, Sept. 1955, pp. 375-386.

21

Statistical evaluation of variability of means will be made by the appropriate one-way analysis of variance technique, followed by a multiple comparison procedure, if needed. The Bartlett's test will be performed to determine if groups have equal variances. If the variances are equal, parametric procedures will be used; if not, nonparametric procedures will be used. The parametric procedure will be standard one-way ANOVA using the F distribution to assess significance. If significant differences among the means are indicated, Dunnett's test will be used to determine which means are significantly different from the control. If a nonparametric procedure for one-way analysis of variance is selected, Kruskal-Wallis or Friedman will be used, and Tukey's HSD or Scheffé's method will be used to determine which treatments differ from control.

Statistical tests for trend in the dose levels will also be performed. In the parametric case (i.e., equal variance), standard regression techniques such as least-squares trend and lack of fit will be used. In the nonparametric case, rank tests for monotonic trend will be used.

The test for equal variance (Bartlett's) will be conducted at the 1% two-sided risk level. All other statistical tests will be conducted at the 5% and 1% two-sided risk levels.

References for these techniques are Spiegel, S.H. and Cochran, W.G., Statistical Methods, 6th edition, Iowa State University Press (1971), Hollander and Wolfe, Nonparametric Statistical Methods, John Wiley & Sons, New York (1973), Dunnett, C.W., J. 22

## APPENDIX B

BIO STAT MULTIPLE GROUP DATA (ABSOLUTE)

Statistical evaluation of equality of means will be made by the appropriate one way analysis of variance technique, followed by a multiple comparison procedure if needed. First Bartlett's test will be performed to determine if groups have equal variance. If the variances are equal, parametric procedures will be used; if not, nonparametric procedures will be used. The parametric procedures will be the standard one way ANOVA using the F distribution to assess significance. If significant differences among the means are indicated, Dunnett's test will be used to determine which means are significantly different from the control. If a nonparametric procedure for testing equality of means is needed, the Kruskal-Wallis test will be used, and if differences are indicated, a summed rank test (Dunn) will be used to determine which treatments differ from control.

A statistical test for trend in the dose levels will also be performed. In the parametric case (i.e., equal variance), standard regression techniques with a test for trend and lack of fit will be used. In the nonparametric case, Jonckheere's test for monotonic trend will be used.

The test for equal variance (Bartlett's) will be conducted at the 1% two-sided risk level. All other statistical tests will be conducted at the 5% and 1%, two-sided risk levels.

References for these techniques are Snedecor, G.W. and Cochran, W.G., Statistical Methods, 6th edition, Iowa State University Press (1967), Hollander and Wolfe, Nonparametric Statistical Methods, John Wiley and Sons, New York (1973), Dunnett, C.W., J. Am. Sta. Assn. 50: 1096-1121 (1955) and Biometrics 20: 482, (1964).

## APPENDIX B

## Two-Group F-test

The variances of the two groups will be tested for equality using the F-test. If the variances are equal, a standard independent two sample t-test will be used to determine equality of means. If the variances differ at the 1% level of significance, Welch's t-test will be used to determine equality of means. T-tests will be conducted at the 5% and 1%, two-sided risk level.

### PREPARATION AND ANALYSES OF DOSING SOLUTIONS

#### 1. METHOD VALIDATION:

Preparation method supplied by the Sponsor will be validated at our laboratory for both corn oil and tricaprylin. Control vehicle will be fortified with test material and will be evaluated for reproducibility of results by the supplied method. Mean and standard deviations will be computed on multiple extractions and injections of the concentration level to be used for the study.

#### 2. STABILITY ANALYSES:

Stability of the test material in corn oil, iso-octane and tricaprylin will be determined on Days 0, 1, 7, 14 and 21. If the data indicates the test material is unstable in solution at room temperature, stored under nitrogen, stability will be re-evaluated.

#### 3. PREPARATION AND ANALYSES OF DOSE SOLUTIONS:

Preparation and analyses of the dose solutions will be performed bi-weekly. Analyses will be performed on each sample prepared to determine that the concentration is within  $\pm$  10% of the nominal concentration prior to dosing. Those not within the acceptable range will be discarded and new solutions will be prepared. Dose solutions will be divided into 21 vials for dosing using the last 7 vials only in the event of the fresh dose solution falling outside the acceptable range. An additional analysis will be performed to determine if the dosing solution degrades during the actual dosing. This will be done by preparing a dose solution and obtaining its concentration. After the concentration is known the solution will be transferred to a dosing vial and mock dosing of twenty doses will be performed. The dosing vial will then be re-analyzed to determine the concentration.

26

PREPARATION AND ANALYSES OF DOSING SOLUTIONS - continued

4. DISPOSAL OF SOLUTIONS:

All solutions containing more than 40 ug/ml of phosphorus will be disposed of according to the method supplied by the Sponsor.

PREPARATION OF ELEMENTAL PHOSPHORUS  
DOSING SOLUTIONS

M.L. Trehy  
Monsanto Company

Revised by: Mark Edfort  
Bio/dynamics, Inc.

The attached method was formulated by Monsanto Company for the preparation of elemental phosphorus in tricaprylin. This method was followed for the preparation of elemental phosphorus in tricaprylin and corn oil.  
Amendments to procedure are included on page 14.

Preparation of Elemental Phosphorus Solutions in Tricaprylin

T. M. Ngo and M. L. Trehy

October , 1988

**Warning:** Elemental white (yellow) phosphorus is spontaneously combustible and toxic. Isooctane and Methanol are flammable.

**Note:** One carbon dioxide fire extinguisher is required at all times. In addition, one safety shower nearby is required. This operation is not to be performed alone, requires at least one person nearby in case of accident, and also requires two people during steps which require weighing to cross-check and record the weight precisely.

White (yellow) phosphorus is very sensitive to oxygen from the air, to u.v light, and is flammable. Tricaprylin is a very expensive material. Therefore, extreme care and precaution should be taken during the preparation of dosing solutions and analytical solutions. Study the material safety data sheet (MSDS) thoroughly and follow the procedure given below in detail in order to avoid injury and loss of experimental work.

I. Equipment needed:

1. One drying oven at 140 degrees centigrade.
2. House N<sub>2</sub> or N<sub>2</sub> cylinder (< 5 ppm oxygen) equipped with an oxygen scrubber unit available from American Scientific Products (Baxter), Part #G5301-1. The N<sub>2</sub> cylinder purchased should have a minimum purity of 99.9% with an oxygen content of less than 5 ppm.
3. One variable transformer connected to a heating mantle that fits the 3 liter - 3 neck round bottom flask.
4. One glass thermometer with temperature range of -10 to 110 degrees centigrade.
5. A thermometer adaptor that fits the 24/40 side neck.
6. A nitrogen glove box, model XPL855AC from Baxter with accessories from Fisher (see attached memo).
7. One glass adaptor that has an open or close valve that fits 24/40 side neck flask (Pyrex brand glass connecting tube with stop cock and 90° angle connection, Fisher 88 - cat #15-324E).
8. An analytical balance with digital display that can weigh to 0.1 mg. (Mettler A-100 obtained through Fisher).
9. A stirring plate that has a base of at least 8" X 6".
10. Two 3 liter pyrex flasks with three vertical necks (side neck: 24/40; center neck: 34/45).

11. 3 liters of 99% tricaprylin. Sigma T-9001. lot # 38F-8371.  
12. Approximately 550 ml. G.C grade isoctane.  
13. Approximately 120 ml. G.C grade methanol.  
14. Two magnetic stirring bars (1 1/2" L X 5/16" D).  
15. Four magnetic stirring bars (1" L X 5/16" D).  
16. One 1 liter filtering flask.  
17. One 500 ml filtering flask.  
18. Six 30 ml beakers.  
19. Two 100 ml beakers.  
20. One vial of purified elemental phosphorus weighing between 0.1 to 0.2 grams as supplied by Monsanto.  
21. Two Braun jeweler, curved forceps (length 4 1/2" obtained from Fisher 88-cat. # 08-953F).  
22. A box of Shur-Wipe Wipers paper tissue, size 15" X 16 1/2", or equivalent Kleenex paper tissue.  
23. A box of aluminum foil wrap - 12" X 100'.  
24. One 250 ml volumetric flask with teflon cap.  
25. Ten 50 ml volumetric flasks with teflon caps.  
26. Fifteen of 1/8" X 1/2" Fisher brand magnetic stirring bars, cat. # 14-511-60.  
27. Two each of No. 6, 7, 8, and 9 rubber stoppers.  
28. Five Pasteur pipette bulbs (2 ml. size).  
29. Twenty each of 15 cm and 23 cm long disposable glass Pasteur pipettes.  
30. A case of 1 ml serum bottles, Borosilicate glass (Fisher cat. # 06-406AA or Varian 1 ml autosampler vials).  
31. A case of one-piece aluminum seals (Fisher 88-cat. #06-406-13A).  
32. One manual crimper (Fisher cat. #06-406-20).  
33. 20 ft of Tygon tubing for connections such as between vacuum line, N<sub>2</sub> line, glass tubing, etc..  
34. A glass marker pen to label bottles, vials, etc., and a scissors for cutting tubing.

- 
- 35. Several 500 ml glass disposal bottles with caps that have plastic liners to contain waste solution. 29
  - 36. Twenty-five of 100 ml serum bottles with one piece aluminum seals and a manual crimper.
  - 37. Four screw-clamps (Fisher hose clamp, Part #5-847).
  - 38. One ring-stand and ring-stand clamp to support flasks.

II. Properties

Elemental phosphorus ignites spontaneously on exposure to air and burns to produce dense white smoke of  $P_2O_5$  or pyrolyzed  $H_3PO_4$ . If wet, the burning phosphorus tends to splatter viciously. Long sleeve rubber gloves, a rubber apron and a face shield are required to prevent burns from a splatter when handling  $P_4$ .

30

Phosphorus is highly toxic. 100 mg is generally fatal. 15 mg is severely toxic upon ingestion.

$P_4$  vapor in air is toxic, the OSHA standard is 100 ug/m<sup>3</sup>

$P_4$  is reputed to be absorbed through skin.

III. Comment on safety:

1. Solid elemental white phosphorus can be exposed to room temperature air for periods of up to about 20 seconds and ignition may not occur. However, the time can vary appreciably depending on temperature, the size and shape, the adherence of a water film, etc. It is recommended that white phosphorus not be exposed to air even for short periods.
2. Phosphorus fires can be extinguished readily with water, inert material (such as sand) or by excluding oxygen with a cover, and also by a carbon dioxide fire extinguisher. Reignition will be rapid unless the material is kept wet or covered. Burning phosphorus may extinguish itself with a coating of phosphoric acid, leaving unburned residue. The smoke from burning phosphorus ( $P_2O_5$  or  $H_3PO_4$ ) is irritating, but not particularly toxic. Combustion in a closed area or with a deficiency of oxygen could conceivably produce toxic concentrations of  $P_4$  vapors.

Important: In the event of a major spill in the nitrogen glove box

\* Methanol and isoctane are flammable!

\* Phosphorus is spontaneously flammable in air!

In the event of a methanol or isoctane spill of more than a 4 ml quantity in the nitrogen glove box, STOP all operations. Make sure all phosphorus is in a closed bottle; if not, return it to a closed bottle. Use tissue to wipe up any spilled methanol or isoctane, and pour any methanol or isoctane into the waste bottle. Flush the glove box for at least one hour with  $N_2$  at the rate of 6 ft<sup>3</sup>/hr. Remove all tissue from the box through the interlock system and dispose of it in a metal bucket where it may be burned. Note: Interlock purged by alternating application of vacuum and then addition of nitrogen to atmospheric pressure 3 times.

In the event any elemental phosphorus is lost in the nitrogen glove box, STOP all operations. Pour all open methanol or isoctane into the waste bottles. Return all phosphorus to a closed container. Continuously flush the box with nitrogen at the rate of 5 ft<sup>3</sup>/hr. Remove all items which are burnable or flammable from the box through a prepurged  $N_2$

interlock system. Be certain that any flammable items are placed in a metal bucket where they may be burned safely in the event of spontaneous combustion. Observe the interior of the box thoroughly for at least ten minutes to be certain no particle of elemental phosphorus is left in the box. If not able to locate the phosphorus, open the box entirely and clean it thoroughly before restarting the operation again.

#### IV. Preparation of Solutions:

The preparation of dosing solutions for toxicity studies of purified elemental white phosphorus at a concentration of 0.0375 mg/ml in tricaprylin and of purified phosphorus in isoctane for stability study by G.C requires extreme care and attention to the following critical steps:

- \* All glasswares or lab-wares must be carefully cleaned and preheated at least at 140 degrees centigrade for one hour and immediately transferred to the nitrogen glove box.
- \* Purge the nitrogen glove box with nitrogen gas that has been scrubbed with an oxygen or air remover unit (American Scientific Products Part #G5031-1) at a rate of 2.0 to 2.5 ft<sup>3</sup>/hr with a minimum of 15 volumes of N<sub>2</sub> and a minimum of 24 hours prior to preparing solutions. Make sure there is a positive nitrogen pressure at all times. NOTE: Make sure all empty bottles, flasks, boxes, cans, etc are opened during N<sub>2</sub> purge.
- \* Check to make sure there is no leak due to a poor seal between the bottom half and top half of the box by using a leak detector solution.
- \* Cover the bottom of the nitrogen box totally with Kimwipe to absorb a minor spill or keep the total system clean to avoid contamination.
- \* Provide a metal can to contain waste tissues and pipettes.
- \* Provide four 500 ml bottles with plastic caps to contain waste solutions. Make certain that these containers are purged with N<sub>2</sub> while in the N<sub>2</sub> glove box.
- \* Four extra large Kimwipe sheets, and 12" x 3' aluminum foil.
- \* Make sure the solutions that contain phosphorus are covered with aluminum foil to prevent white phosphorus exposure to light which converts to red P<sub>4</sub>.

b2

1. Preparation of dosing and analytical solutions: All steps below follow in sequence and must be done in N<sub>2</sub> glove box. Label everything immediately to prevent mix-up.
2. Place all of preheated (1 hour at 140°C) glasswares, labwares, and equipments necessary for the experimental work into a nitrogen glove box.
3. Purge the box with nitrogen gas that has been scrubbed with a proper oxygen or air remover unit at a rate of 2.0 to 2.5 ft<sup>3</sup>/hr with a minimum of 15 volumes of N<sub>2</sub> and for a minimum of 24 hours. Once purged, maintain continuous N<sub>2</sub> flow.
4. Pour approximately 2200.0 ml of tricaprylin (Sigma T-9001, 38F-8371) into a 3 liter - 3 neck - round bottom flask and place a stirring bar (1 1/2" L x 5/16" D) into the flask.
5. Check the the nitrogen flow rate into the nitrogen glove box to assure a flow rate of 2.0 or 2.5 ft<sup>3</sup>/hr and start deaerating tricaprylin at 60 degrees centigrade for at least twelve hours after reaching 60°C as shown in Figure I. Carefully set a mild nitrogen flow through the tricaprylin as a result of positive pressure of nitrogen from the box and control the flow of nitrogen by a hose clamp while pulling a vacuum on the erlenmeyer flask. The temperature of tricaprylin is monitored by a thermometer and controlled by a variable transformer or with a thermowatch.
6. Deaerate approximately 500.0 ml G.C grade isoctane at room temperature for at least 30 minutes as shown in Figure II. NOTE: A mild amount of nitrogen bubbles inside the flask is controlled similarly to step 4.
7. Deaerate approximately 100.0 ml G.C grade methanol at room temperature for 10 minutes as shown in Figure III. NOTE: A mild amount of nitrogen bubbles inside the flask is controlled similarly to step 4.
8. Set up empty 3 liter 3 neck round bottom flask similar to step 4.
9. Pour a precut chunk of purified elemental phosphorus (weighing approximately between 0.10 to 0.2g) contained in a small vial of deaerated deionized water into a 30 ml beaker and use a sharp-edged 3-inch wooden spatula to cut the chunk of phosphorus in half.
10. Pour approximately 15 ml of deaerated G.C grade methanol prepared in step 6 to a 30 ml beaker.

11. Zero the digital Mettler balance, Model AE-100.
12. Transfer the chunk of phosphorus in step 10 by means of a curved microforceps onto a clean Shur-Wipe or Kleenex paper tissue to dry off methanol by rolling the chunk several times. Transfer the chunk to a prepared balance and obtain its weight. Immediately transfer it to the 3 liter flask in step 7.
13. Volumetrically transfer the proper amount of deaerated tricaprylin prepared in step 3 into 3 liter -3 neck round bottom flask containing P<sub>4</sub> by means of a 500 and 100 ml graduate cylinder.

NOTE: Make sure the deaerated tricaprylin is no longer dripping from the graduate cylinder during the transfer to the flask. The X-amount of deaerated tricaprylin required in order to obtain a concentration of 0.0375 mg P<sub>4</sub>/ml tricaprylin can be calculated as follows:

$$X\text{-ml of tricaprylin} = \frac{\text{weight of P}_4 \text{ in mg}}{0.0375 \text{ mg/ml}}$$

14. Dissolve P<sub>4</sub> in deaerated tricaprylin at 60 degrees centigrade for 2 1/2 hours as shown in figure IV. NOTE: Make sure the phosphorus is totally dissolved by visual observation for at least 5 minutes. Also cover the flask with aluminum foil during the dissolving step. Transfer the prepared solution to many 100 ml serum bottles with one piece, aluminum seal caps.
15. Transfer a weighed chunk of phosphorus (similar to the step of preparing P<sub>4</sub> in tricaprylin) to a clean 250 ml volume and pour deaerated G.C grade isoctane to the mark by means of a glass 65 mm mouth funnel. Carefully place a 1" L x 5/16" D magnetic stirring bar to the flask and cap the flask with a teflon cap. Wrap the flask with aluminum foil while waiting for P<sub>4</sub> in tricaprylin to dissolve in step 14.
16. Stir P<sub>4</sub> in isoctane for 1 1/2 hours at room temperature to dissolve P<sub>4</sub> and make sure P<sub>4</sub> is totally dissolved by visual observation for at least 5 minutes. NOTE: The phosphorus should be completely dissolved within this period if the concentration is less than 350 ppm. The solution prepared in step 16 is considered a stock solution.

17. Transfer proper amounts of solutions prepared in step 14, P<sub>4</sub> in tricaprylin, and weigh them. The weighings are done each into three separate preweighed 50 ml volume flasks in such a way that the concentration of P<sub>4</sub>, after diluting to the mark with deaerated isoctane (prepared in step 5), fall into a 0.3 to 1.0 mg P<sub>4</sub>/liter solution. Carefully place a 1/8" x 1/2" magnetic stirring bar into each of the flasks and cap the flasks with teflon caps. Stir these solutions for at least 10 minutes. NOTE: One also prepares another 50 ml solution similar to the step 17 with the exception of diluting with deaerated tricaprylin. These four solutions are used for stability study by G.C analysis. The concentration of P<sub>4</sub> with respect to the total solution is calculated as follows:

Concentration of P<sub>4</sub> after dilution (or P<sub>4</sub> with respect to total solution) ug/ml

$$\frac{\text{Grams of solution in step 17}}{\text{Density (Tricaprylin or Isooctane) in g/ml}} \times (\text{Concentration of P}_4 \text{ solution in step 17}) \text{ ug/ml} = 50 \text{ ml.}$$

where density of trycaprylin is equal to 0.950 g/ml and where density of icoctane is equal to 0.692 g/ml.

18. Transfer an appropriate amount of stock solutions prepared in step 16, P<sub>4</sub> in isoctane, each into one of three separate preweighed 50 ml volumetric flasks, and weigh them. The weighings of stock solution are done in such a way that the concentration of P<sub>4</sub>, after being diluted to the mark with deaerated isoctane prepared in step 5, fall into 0.3 to 1.0 mg of P<sub>4</sub>/liter solution or ug/ml. Carefully place a 1/8" X 1/2" magnetic stirring bar into each of the flasks and cap the flasks with a teflon cap. Stir these solutions for at least 10 minutes. NOTE: One also prepares another solution similar to step 18 with the exception of diluting with deaerated tricaprylin. These first three solutions are used to establish a standard calibration curve by G.C and the fourth one is used to cross-check stability of P<sub>4</sub> solution in step 17. The concentration of P<sub>4</sub>, with respect to the total solution is calculated as follows:

Concentration of P<sub>4</sub> after dilution (or P<sub>4</sub> with respect to total solution) ug/ml

$$\frac{\text{Grams of solution in step 18}}{\text{Density (Trycaprylin or Isooctane) in g/ml}} \times (\text{Concentration of P}_4 \text{ solution in step 18}) \text{ ug/ml} = 50 \text{ ml.}$$

where density of trycaprylin is equal to 0.950 g/ml and where density of icoctane is equal to 0.692 g/ml.

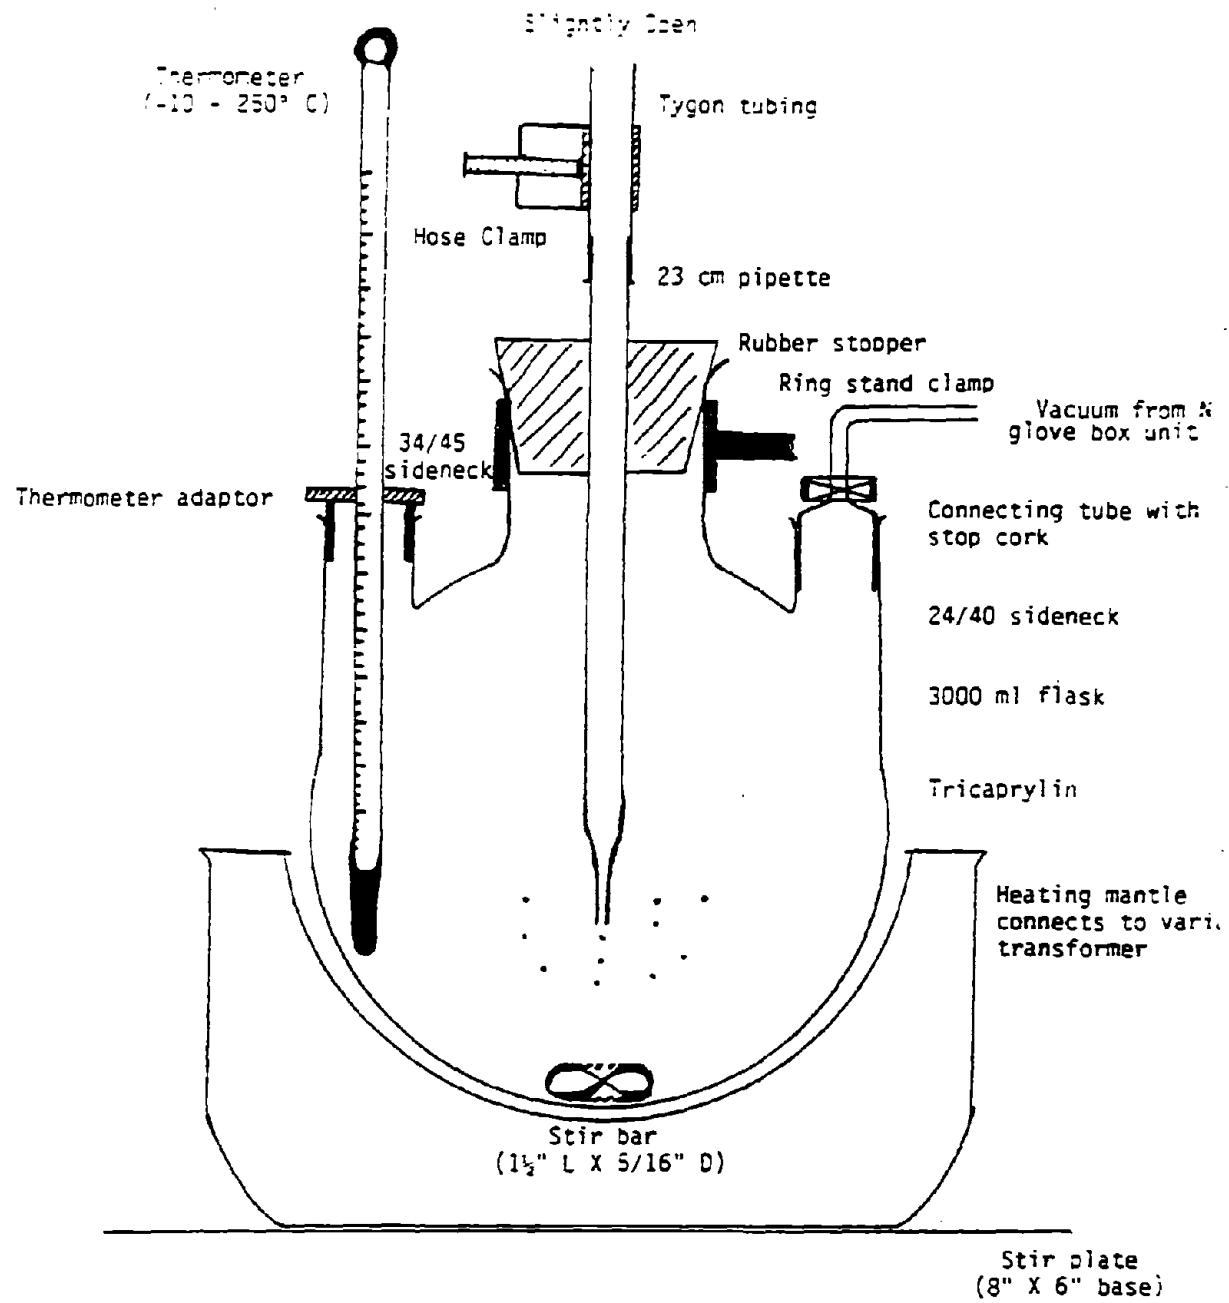

19. Transfer each of the solutions prepared in steps 17 and 18 into at least 10 vials of 1 ml capacity by means of 13 cm disposable glass pipette with bulb. Seal the vials with one piece aluminum seals using a manual crimper. These prepared vials are either loaded into the sample tray of the G.C. or stored in a dark and cool ( $20^{\circ}\text{C}$ ) place, if not in use. The procedure for the stability of  $\text{P}_4$  in tricaprylin or isoctane by G.C was reported earlier in Report No. MSL-7144 and ES-87-SS-01 and a copy is attached.

B. Disposal of waste solutions, pipettes, and contaminate paper tissues:

All steps done outside  $\text{N}_2$  glove box have to be burned inside the hood. As mentioned previously in the safety and preparation of solution, the steps require extreme care and precaution. The disposal of wastes also requires similar attention. For example, never mix waste solutions with different constituents into the same waste-bottle. Following is step-by-step disposal of waste material:

1. Half-fill a 5 gallon steel bucket with sand and cover the top of the sand with aluminum foil. Then place a 250 ml ceramic crucible into the metal bucket and place the bucket inside the hood.
2. Pour 2 ml of waste solution into the ceramic crucible and use a propane blowtorch to burn the wastes. NOTE: Always wear rubber apron, rubber gloves and face shield during this operation.
3. Make sure there are no more spontaneous sparks under continuous burning by the propane torch and wait for the crucible to cool to room temperature before adding more waste solution.
4. Perform similar procedures with glassware that contains small traces of waste material (similar to step 2.).
5. Dip all of the glassware in step 4 into a 50% NaOH solution and leave it overnight before cleaning several times with brush and water.
6. The waste paper tissues can be burned totally by blow torch and disposed in paper disposal bucket.

AMMENDMENTS TO PROCEDURE

40

Page 7, No. 7: Delete this Step.

Page 7, No. 12: Change to: Transfer the chunk of phosphorus in Step 10 by means of a curved microforcep onto a clean paper tissue to dry off methanol by rolling the chunk several times. Transfer the chunk to a prepared balance and obtain its weight. Immediately transfer it to a 500 ml round bottom flask containing 250 ml of tricaprylin or corn oil.

Page 7, No. 13: Change to: Concentration of the stock solution is calculated by the equation:

$$\text{Concentration of P}_4 \text{ in stock solution (ug/ml)} = \frac{\text{mg P}_4 \text{ added}}{250 \text{ ml}} \times \frac{1000 \text{ ug}}{1 \text{ mg}}$$

Page 7, No. 14: Change to: Dissolve P<sub>4</sub> in deaerated vehicle at 60°C for 2 1/2 hours under continuous stirring. Make sure the phosphorus is totally dissolved by visual observation for at least 5 minutes. Cover the flask with aluminum foil during dissolving step. After P<sub>4</sub> is totally dissolved the dilution to the dose level is calculated using the following equation:

$$\text{ml of stock soln. needed} = \text{final volume needed (ml)} \times \frac{\text{concentration needed}}{\text{concentration stock soln.}}$$

Stir dose solution for 1/2 hour then transfer the solution to serum bottles for dosing.

Page 7, No. 15: Refer to Analytical Method for analysis for the remainder of the procedure.

ANALYTICAL METHOD FOR THE DETERMINATION OF  
ELEMENTAL PHOSPHORUS IN DOSING SOLUTIONS  
BY GAS CHROMATOGRAPHY

Method No.: BD-028-88

X2

ANALYTICAL METHOD FOR THE DETERMINATION OF  
ELEMENTAL PHOSPHORUS IN DOSING SOLUTIONS  
BY GAS CHROMATOGRAPHY

1.0 SCOPE

This method describes the analytical procedure for the determination of elemental phosphorus in dosing solutions by gas chromatography. The limit of detection is 0.2 ng injected (2  $\mu$ l of 0.1 ug/ml standard).

2.0 PRINCIPAL

Concentrations of elemental phosphorus in corn oil and tricaprylin are determined by gas chromatography following appropriate dilution of the sample in iso-octane. The final determination is made using a flame photometric detector (FPD) at 130°C with a 6 foot column packed with 5% Dexil 410 on Chromosorb G 80/100.

3.0 EQUIPMENT

Warning: Elemental white phosphorus is spontaneously combustible and toxic. Iso-octane and Methanol are flammable. One carbon dioxide fire extinguisher is required at all times. In the event of a methanol or iso-octane spill of more than a 4 ml quantity in the nitrogen glove box, STOP all operations. MAKE SURE all phosphorus is in a closed bottle. Clean up spillage with tissues and flush the glove box for at least one hour with nitrogen at a rate of 6 cu. ft./hr. Remove all tissues and contaminated solvents from the glove box.

3.1 Drying oven (temp. up to 140°C)

3.2 Nitrogen glove box equipped with two nitrogen tanks. (See mixing procedure)

3.3 Analytical balance                          Mettlers AE 260 or equivalent

3.4 Stir plate

3.0 EQUIPMENT - continued

3.5 Approximately 600 ml HPLC grade Iso-octane

3.6 Approximately 200 ml HPLC grade Methanol

3.7 Magnetic stir bars:

10 - 1/8" x 1/2" stir bars

2 - 1 1/2 " x 5/16" stir bars

4 - 1" x 5/16" stir bars

3.8 Filter flasks: 1 liter and 500 ml

3.9 Beakers: 4 - 100 ml, 2 - 30 ml

3.10 Vial of purified elemental phosphorus supplied by Monsanto

3.11 Curved forceps (Fisher Cat. #08-953F)

3.12 Kimwipes

3.13 Aluminum foil

3.14 Class A volumetric flasks:

16 - 50 ml, 1 - 100 ml

3.15 Rubber stoppers

3.16 Dispo pasteur pipets

3.17 Tygon tubing

3.18 Scissors

3.19 Glass marker pen

3.20 2 - waste bottles

3.21 Ring-stand and ring-stand clamp

3.22 Screw cap GC vials with cap and septum

NOTE. All glassware and labware must be carefully cleaned and preheated to at least 140°C for one hour and immediately transferred to the nitrogen glove box. All equipment must be placed in the nitrogen glove box at least 24 hours before starting procedure. Nitrogen glove box is then purged with nitrogen at a rate of 2.5 cu. ft./hr for at least 24 hours prior to the start of the procedure. Make sure there is a positive nitrogen pressure at all times. Also, make sure all empty bottles, flasks and vials are opened during the nitrogen purge.

1.0 REAGENT PREPARATION

1.1 Deareration of Iso-octane:

1.1.1 Deaerate approximately 600 ml of iso-octane at room temperature for at least 30 minutes as shown in Figure A. The flow of nitrogen is controlled with the valve above the stoppers shown in the Figure.

1.2 Deareration of Methanol:

1.2.1 Deaerate approximately 150 ml of methanol at room temperature for ten minutes as shown in Figure B. The flow of nitrogen is controlled with the valve above the stopper as shown in the Figure.

5.0 PROCEDURE

5.1 Standard Preparation:

5.1.1 Pour a precut chunk of purified elemental phosphorus into a 30 ml beaker and use a sharp-edged 3-inch wooden spatula to cut the chunk of phosphorus in half.

5.1.2 Pour approximately 15 ml of deaerated methanol to a 30 ml beaker. Transfer a chunk of phosphorus from Step 5.1.1 (chunk of phosphorus should weigh approximately 60 mg) into the 30 ml beaker containing methanol.

5.1.3 Zero the digital balance.

5.1.4 Transfer the chunk of phosphorus from Step 5.1.2 onto a clean Kimwipe to dry methanol off.

5.0 PROCEDURE - continued

5.1 Standard Preparation - continued:

5.1.5 Transfer the chunk to a prepared balance and obtain its weight and immediately transfer it to a 100 ml volumetric flask containing approximately 50 ml of iso-octane. Bring the volume up to the mark with iso-octane.

5.1.6 Add a stir bar to the volumetric flask and wrap the flask with aluminum foil. Stir phosphorus in iso-octane for at least 1 1/2 hour at room temperature to dissolve. Make sure that the phosphorus is totally dissolved. This solution will be considered the stock standard and will be prepared fresh monthly. The concentration of the stock standard should be approximately 700 ug/ml.

5.1.7 Intermediate standard is prepared by weighing an amount of the stock standard prepared in section 5.1.6 directly into a 50 ml volumetric flask. Dilute to volume with iso-octane. The concentration of the intermediate standard should be approximately 40 ug/ml. The concentration of phosphorus with respect to the solution is calculated using the following equation:

Concentration of P<sub>4</sub> after dilution (ug/ml) =

$$\frac{\text{grams of stock standard}}{\text{density of iso-octane (g/ml)}} \times \frac{\text{concentration of stock standard (ug/ml)}}{50 \text{ ml}}$$

Density of iso-octane is equal to 0.692 g/ml.

5.0 PROCEDURE - continued

5.1 Standard Preparation - continued:

5.1.3 Injection standards are prepared by weighing four different amounts of the intermediate standards directly into 50 ml volumetric flask. These are brought to volume with iso-octane. The standard range should be between 0.1 and 1.0 ug/ml. Standards are stirred for 10 minutes prior to use. All standards are stored at room temperature in the nitrogen glove box. All standards are prepared fresh monthly.

5.2 Sample Preparation:

Samples are diluted to 50 ml with iso-octane to fall within the standard range. Samples are diluted in duplicate and injected in triplicate to arrive with an average concentration per sample. The concentration of phosphorus with respect to the solution is calculated using the following equation:

$$\frac{\text{grams of stock solution}}{\text{density of vehicle (g/ml)}} \times \frac{\text{concentration of stock solution (ug/ml)}}{50 \text{ ml}}$$

Density of tricaprylin = 0.950 g/ml  
Density of corn oil = 0.921 g/ml

*600-3200-000*

---

## 6.0 CHROMATOGRAPHIC ANALYSIS

A standard curve is generated by injecting at least three different concentration standards at the start of the run, a standard after every four samples and at the end of the run. The peak area of phosphorus versus concentration of phosphorus is plotted to construct the standard curve. A standard correlation coefficient is then calculated by linear regression and the sample concentrations are obtained using this coefficient. A typical standard curve is shown in Figure C. Gas chromatographic conditions are given in Table A. Typical sample and standard chromatograms are depicted in Figure D.

Dr. Rashmi Nair - G2WD  
Monsanto Company  
800 North Lindbergh Boulevard  
St. Louis, Missouri 63167

Ref: 401-189 (IR-82-215)

Dear Dr. Nair:

Enclosed are three copies of the final report on your One Generation Reproduction Study in Rats with Elemental Phosphorus (IR-82-215).

In general, your comments have been incorporated in the final report. We feel that additional explanation is necessary for several items. In regards to the number of dead F<sub>1a</sub> Pups, it has been determined that a total of 47 were found dead and subsequently necropsied. Of the original 49 mentioned in the text, two were sacrificed due to death of the dam. Sixteen were missing, or partially cannibalized and discarded without necropsy being performed. The discrepancy of five between your total of 58 and our total of 63 is due to five pups from litter #18049. These pups were found dead and necropsied, however, were not included in the pup survival index because of the death of their dam. This has been clarified both in the text and on the appropriate summary table.

Reevaluation of the F<sub>1b</sub> litter data and necropsy records revealed that 31 pups were found dead and necropsied, while 12 were either missing, or partially cannibalized and discarded without necropsy being conducted.

The female fertility values for the low- and high-dose groups in the F<sub>1b</sub> mating were verified as correct. One female from each of these groups died on an early gestation day, and because pregnancy status for either animal could not be determined, they were excluded from the index calculation. An appropriate footnote has been added to the F<sub>1b</sub> Summary of Gestation and Lactation Data (Table 9).

If you should have any questions relative to the enclosed report, please do not hesitate to contact me.

Sincerely,

James L. Schardein, M.S.  
Assistant Director, Toxicology  
Division and Director of  
Reproduction and Teratology

I. SUMMARY: One Generation Reproduction Study in Rats with Elemental Phosphorus (IR-82-215)  
IRDC Study 401-189  
Initiated October 19, 1982  
Terminated May 16, 1983

---

Elemental phosphorus was administered orally by gavage to Charles River COBS® CD® rats at dosage levels of 0.005, 0.015 and 0.075 mg/kg/day at a dose volume of 5 ml/kg. Administration of the test and control articles (corn oil) to both sexes began 80 days prior to mating. The F<sub>0</sub> generation was mated twice to produce "a" and "b" offspring. In males dosing continued until sacrifice. Administration to the females continued through gestation and weaning of the pups. Individual dosages were based on the most recent weekly body weights.

A. EXPERIMENTAL DESIGN/METHODS

TEST ARTICLE

Identification:

Elemental phosphorus  
Fisher Lot # 701628

Concentrations:

0.001, 0.003, 0.015 mg phosphorus/  
ml of prepared test material

Analysis:

Conducted at IRDC; the prepared test solutions were stirred overnight using a magnetic stir plate and bars and analyzed after complete dissolution of the phosphorus. Prior to administration to the test animals, samples from each level and batch were analyzed in duplicate.

TEST SYSTEM/IN-LIFE OBSERVATIONS

Animals:

Charles River COBS® CD® rats,  
Charles River Breeding Laboratories, Portage, MI, 56 days (8 weeks) of age at initiation.

***International Research & Development Corporation***

---

Dosage Groups:

Dosage level (mg/kg/day)	Number of Rats	
	Male	Female
0 (Control)	15	30
0.005	15	30
0.015	15	30
0.075	15	30

Randomization Procedure:

Computerized random selection with animals more than  $\pm$  1.5 standard deviation from the quarantine population body weight mean eliminated prior to randomization. Homogeneity of group mean body weight variances was used as the criterion for acceptance.

Housing/Environmental Conditions:

All animals were housed in an environmentally controlled room with an average temperature of 23  $\pm$  2°C and average humidity of 50  $\pm$  15 percent. Fluorescent lighting provided illumination 12 hours per day. During the study, rats were housed individually in suspended wire-mesh cages except during mating, gestation and lactation. During these periods, animals were housed in plastic cages with wood shaving bedding. On gestation day 0, the females were housed individually in the plastic cages, until the end.

Diet:

Certified Ralston Purina Rodent Chow® #5002; available ad libitum during acclimation and throughout study.

Observations:

All parental animals were observed for mortality and signs of overt toxicity twice each day (morning and afternoon), seven days a week. If mortality or signs of overt toxicity were observed, these were recorded on the day observed.

(6)

*International Research & Development Corporation*Observations (Cont):

During treatment, a detailed clinical observation of each animal was performed weekly and the findings recorded.

Measurements:

Body Weights: Parental males and females were weighed weekly during treatment until sacrifice. Females were also weighed on gestation days 0, 7, 13 and 20 and on days 0, 7, 14 and 21 of lactation.

Food Consumption: Individual food consumption was measured for all parental animals weekly except during the mating period when the animals were cohabitating.

Mortality: Any rat showing signs of severe debility or toxicity, particularly if death appeared imminent, was sacrificed to prevent loss of tissues through autolysis. All rats sacrificed in extremis or found dead were subjected to a routine necropsy procedure.

Estrous Cycle Determinations: Ten days prior to mating and until evidence of copulation was observed or the mating period ended, the females were smeared daily to establish estrous cycles.

Reproductive and Litter Parameters: Specific reproductive observations included tabulation of male and female fertility indices and the length of gestation. Any abnormalities in nesting and nursing behavior and difficulties at parturition were recorded. Litter parameters assessed included mean number of live and stillborn pups per litter (litter size), pup survival through weaning, pup weight at birth and at specified intervals during lactation and general appearance and behavior.

*International Research & Development Corporation*STATISTICSMethods:

All statistical analyses compared the treatment groups to the control group with the level of significance at  $p<0.05$  and  $p<0.01$ . The male and female fertility indices were compared using the Chi-square test criterion with Yates' correction for  $2 \times 2$  contingency tables and/or Fisher's exact probability test as described by Siegel to judge significance of differences. Pup survival indices were compared by the Mann-Whitney U-test as described by Siegel and Weil to judge significance of differences. Parental body weights (at the study week prior to mating and at termination of generation), mean number of live pups per litter at birth and mean pup body weights taken on lactation day 0, 4, 7, 14 and 21 were compared by analysis of variance (one-way classification), Bartlett's test for homogeneity of variances and the appropriate t-test (for equal and unequal variances), as described by Steel and Torrie using Dunnett's multiple comparison tables to judge significance of differences.

Randomization:

Animal numbers and corresponding body weights were entered onto magnetic tape which was used as the data source for the randomization procedure. The mean body weight and standard deviation were calculated by sex and a computer-generated edit developed a listing of those animals whose body weights were within  $\pm 1.5$  standard deviations of the mean. From the qualifying animals, the randomization procedure selected and assigned the required number

*International Research & Development Corporation*

---

Randomization (Cont.):

of animals. Bartlett's test for homogeneity of variances was applied to the groups. If the group variances were judged to be nonhomogeneous, new randomizations were generated until homogeneity was established.

65

*International Research & Development Corporation***B. RESULTS**

Three F<sub>0</sub> male rats did not survive until study termination: One male in the control group died due to cystitis, one low-dose male died due to an intubation error and one male in the low-dose group was sacrificed in extremis. The F<sub>0</sub> male deaths were not considered treatment-related. Four, one, one and sixteen F<sub>0</sub> females in the control, low-, mid- and high-dose groups, respectively, died during the study. Thirteen females in the high dose group, seven in the F<sub>1a</sub> and six in the F<sub>1b</sub> matings, died on gestation days 21 or 22. These deaths may have resulted from difficulties at parturition. Except for one female in the control group that died due to an intubation error and one high-dose female that died due to a rupture of the uterine wall, the cause of death could not be determined for the remaining F<sub>0</sub> females that died on study.

There were no meaningful differences in the antemortem and necropsy observations between the control rats and rats in treated groups that survived to study termination. During both the F<sub>1a</sub> and F<sub>1b</sub> overall gestation and lactation periods, the group mean maternal body weight change values of the treated groups were comparable to the control group values. Male and female fertility indices and the length of gestation of all treated groups in both the F<sub>1a</sub> and F<sub>1b</sub> matings were comparable to the control group. Treatment related reductions in the mean numbers of viable pups at birth and an increase in the mean numbers of stillborn pups occurred at the high-dose level during both matings in comparison to the control group values. There was also a reduction in pup survival at lactation day 0 for this dosage group during the F<sub>1a</sub> mating when compared to the control group value.

There were no meaningful differences in the litter parameter values (pup survival to weaning, pup weight at birth, pup weights during lactation) of the treated groups when compared to those of the control

*International Research and Development Corporation*

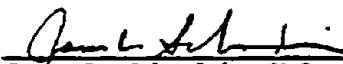

---

group. Also, no physical or behavioral differences were observed between pups in the treated groups and those in the control group. Necropsy examinations of pups that died during study did not reveal any meaningful differences between the control and treated groups. There were no macroscopic or microscopic compound-related changes observed during post-mortem examination of animals from the F<sub>0</sub>, F<sub>1a</sub> or F<sub>1b</sub> generations.

In conclusion, it was determined that elemental phosphorus administered orally by gavage at a dosage level of 0.075 mg/kg/day adversely affected parturition, decreased the mean number of viable pups at birth and increased the mean number of stillborn pups in Charles River COBS® CD® rats. Similar findings were not observed at dosage levels of 0.015 mg/kg/day or less.

To the best of my knowledge, there were no significant deviations from the Good Laboratory Practice Regulations which affected the quality and integrity of the study. This study was conducted in conformance with the Good Laboratory Practice Regulations. This report accurately reflects the raw data obtained during the performance of the study.

### **III. INTRODUCTION**

This study was conducted in accordance with the protocol as approved by the Sponsor and in compliance with the Standard Operating Procedures of International Research and Development Corporation (IRDC). Procedures pertinent to this study are described herein.

#### **A. OBJECTIVE**

The objective of this study was to determine the effect of the test article on fertility, parturition, neonatal viability, growth of the newborn and reproductive performance in rats. The study design utilizes treatment of both sexes.

#### **B. SPECIES SELECTION**

The rat is an acceptable model for reproduction studies. This laboratory has historical control data on the fertility, neonatal survival indices and growth rates and the reproductive performance in rats of this strain from this source.

#### **C. JUSTIFICATION FOR ROUTE OF ADMINISTRATION**

The test article was administered orally by gavage as this was one of the potential routes of exposure to humans.

#### **D. DATA RETENTION**

All preservable specimens, raw data, a sample of the test article and copies of the final report are retained in the International Research and Development Corporation Archives in Mattawan, Michigan.

*International Research & Development Corporation***IV. TEST ARTICLE****A. RECEIPT AND DESCRIPTION**

The test article was received from Fisher Scientific Co., Fair Lawn, New Jersey on February 16, 1982 as indicated below:

<u>Label</u>	<u>Description</u>
P-104	Yellow solid
500 g	
(1.1 lb.)	
Phosphorus	
Yellow Sticks - 5/8" Diameter	
Lot	
701628	

**B. TEST ARTICLE SAMPLES**

The stability of phosphorus in corn oil has been established as at least 17 days by the Sponsor. The prepared test solutions were stirred overnight using a magnetic stir plate and bars and analyzed 24 hours after preparation to allow for complete dissolution of the phosphorus. Prior to administration to the test animals, samples from each level and batch were analyzed in duplicate. Assay values which deviated from expected ranges were considered out of tolerance and were not administered to the animals. A replacement solution was prepared immediately and analyzed.

**C. TEST ARTICLE PREPARATION AND ADMINISTRATION****1. Base Solution Preparation**

The base solution was prepared in the following manner. A stick of elemental phosphorus was quickly transferred to a pan of water. A piece approximately 2 mm thick was cut and transferred to a beaker of water. Approximately 10 ml of water was added to an Erlenmeyer flask. The outside and inside of the neck were dried and the flask, with stopper,

---

*International Research & Development Corporation*

---

was tared on an analytical balance using care to avoid wetting the stopper. The piece of elemental phosphorus was transferred from the beaker of water to a beaker containing acetone. The elemental phosphorus was then transferred to a paper towel, turned once or twice to dry the acetone, and then quickly transferred to the tared Erlenmeyer flask. The stoppered flask containing the elemental phosphorus was then reweighed to determine the weight of the test article. The required amount of vehicle, corn oil, needed to achieve the proper concentration of 1.0 mg elemental phosphorus/ml prepared base solution was calculated. The appropriate amount of corn oil was then added to a stoppered bottle. The bottle was purged with CO<sub>2</sub>. The piece of elemental phosphorus was transferred to the beaker of acetone and dried on a paper towel, as before, then quickly added to the bottle containing the required volume of oil. The bottle was repurged with CO<sub>2</sub> and stoppered tightly. The bottle was immersed in a hot water (60°C) bath and shaken to dissolve the elemental phosphorus. The solution was stirred on a magnetic stir plate for at least 24 hours.

#### 2. Groups 2, 3 and 4 Preparation

The corn oil used for the base solution and these dilutions had the air removed by heating the oil in a suction flask and stirring with a magnetic stir bar.

The required amount of oil for each group was transferred to the appropriate bottles. These bottles were purged with CO<sub>2</sub>. A syringe was purged with CO<sub>2</sub>. The bottle of base solution was pierced with a needle and CO<sub>2</sub> was expelled into the bottle. The bottle was inverted and the syringe was drawn full. Any bubbles were expelled into the base solution bottle. The volume in the syringe was adjusted to the exact quantity required before removing the needle. The appropriate purged bottle containing diluent oil was pierced with the needle, the base solution was expelled into the bottle, and the needle and syringe were

---

*International Research & Development Corporation*

---

withdrawn. The bottles were shaken to ensure a homogeneous mixture. The test article was prepared, approximately, every two weeks at concentrations to permit the administration of dose levels 0.005, 0.015, and 0.075 mg/kg/day at a constant dosage volume of 5 ml/kg.

The test article was administered orally by gavage as a single dose at approximately the same time each day. Administration of the test article to both sexes began 80 days prior to mating. In males, dosing continued until sacrifice. Administration to the females continued through gestation and weaning of the pups. The control group received the vehicle only, corn oil, on a comparable regimen at a volume of 5 ml/kg. Individual dosages were determined from the most recent weekly individual body weights.

### 3. Analysis

#### a. Analytical method for the determination of phosphorus in test solutions.

##### (1) Equipment

- Instrument. Varian Aerograph model 3700 equipped with an F.P.D. and operated in the phosphorus mode.
- Column. 6' x 2 mm I.D. glass column packed with 1.5% OV 101 on 100-120 mesh Chromosorb G.H.P.
- Analytical balance
- Miscellaneous glassware washed with dilute hydrochloric acid, deionized water and acetone.

##### (2) Reagents

- Hydrochloric acid
- Acetone
- Isooctane UV grade

##### (3) Gas chromatographic conditions

Temperature: Column 95°C, Detector 235°C, Injector 230°C

Carrier/flow: Nitrogen/24 ml/min

Injection volume: Variable

Attenuation: Variable

The parameters were varied as required in order to achieve the desired chromatographic characteristics of the test article.

*International Research & Development Corporation*(4) Cleaning of Elemental Phosphorus:

- (A) Place a portion of phosphorus under distilled or deionized H<sub>2</sub>O in a shallow dish. Use a spatula or small knife and tongs to scrape off as much of the oxidized coating as possible. Be careful to keep phosphorus under water at all times. Rinse with distilled H<sub>2</sub>O.
- (B) Rinse the test article with acetone and place in container with ~ 100 ml isoctane. Swirl gently until any remaining oxide coating is dissolved. Remove cleaned test article from isoctane, rinse with acetone, and place in small jar containing enough fresh distilled H<sub>2</sub>O to cover test article. Purge jar with N<sub>2</sub> and cap securely. Cover jar completely with aluminum foil and store in a cool dark place until needed.

(5) Standards Preparation:(A) Original Stock Solution:

Take a small clean piece of test article (about 20 mg) and rinse thoroughly with acetone. Quickly dry with paper toweling and place into a tared 100 ml volumetric flask containing about 20 ml of isoctane. Reweigh the flask to determine weight of test article added (to the nearest 0.1 mg). Dilute to volume with isoctane and mix until test article is dissolved. Test article is very slow to dissolve. Prepared in this manner, the stock solution contains about 200 µg/ml test article which is near the saturation point of test article in isoctane. If a test article stock solution of a higher concentration is used, the original stock solution may be made using toluene as the solvent.

(B) Working Stock Solution:

Make up a 10 µg/ml solution at this point to prepare actual G.C. standards. Calculate the ml of original stock solution needed per 100 ml working stock solution. The ml needed can be measured out using volumetric pipets or by assuming the density of isoctane to be 0.688 g/ml and weighing the original stock solution into a tared 100 ml volumetric flask then diluting to the mark.

73'

*International Research & Development Corporation*

---

(C) G.C. Working Standards:

Prepare working standards in the 10, 32 and 180 µg/l range for use with Groups 2, 3 and 4, respectively, by diluting appropriate aliquots of the 10 µg/ml stock standard with isoctane. All standard solutions should be tightly capped, sealed with tape and stored in a cool dark place.

(6) Preparation of Corn Oil Samples:

Tare a series of volumetric flasks and, using a plastic disposable syringe, transfer 80-110 mg of prepared test material into respective flasks and re-weigh. Record weight to nearest 0.1 mg. Dilute to mark with isoctane and record weight. Mix well. Sample is ready for analysis.

(7) G.C. Analysis:

Inject equal volumes of sample and the appropriate standard into a chromatograph set up as described in step 3.

(8) Calculations:

$$\text{µg Test Article/liter} = \frac{\text{Peak Height (mm)} \text{ Sample} \times \text{µg/liter Standard}}{\text{Peak Height (mm)} \text{ Standard}}$$

$$\text{µg Test Article/ml} = \frac{\text{µg/L Test Article Found in Sample} \times \text{g (Solvent & Sample)}}{\text{mg Standard} \times 0.688^2} \times 0.914^1$$

10.914 = density of corn oil  
20.688 = density of isoctane

*NY*

*International Research and Development Corporation*

---

4. Results

a. Results of Periodic Test Solution Analysis

All test solutions analyzed prior to use from study week 2 through 31 and found to contain within  $\pm$  15% of the target test article concentration were certified for use. The mean concentration of all the certified solutions ranged from 99 to 101% of the desired levels. Although the  $\pm$  15% specification was set at the end of study week 1, the week 1 results were within 15% of the target values.

The data are summarized in Table 1.

**V. STATISTICS****A. METHODS****1. F<sub>0</sub> Randomization Procedure**

Animal numbers and corresponding body weights were entered onto magnetic tape which was used as the data source for the randomization procedure. The mean body weight and standard deviation were calculated by sex and a computer-generated edit developed a listing of those animals whose body weights were within  $\pm 1.5$  standard deviations of the mean. From the qualifying animals, the randomization procedure selected and assigned the required number of animals. Bartlett's test for homogeneity of variances was applied to the groups. If the group variances were judged to be nonhomogeneous, new randomizations were generated until homogeneity was established.

**2. Data Analysis**

All statistical analyses were two-tailed with a level of significance of  $p<0.05$ . Significance at  $p<0.01$  was also indicated.

**a. Parental Body Weights**

Parental body weights by sex were analyzed on the week prior to the F<sub>1a</sub> mating (week 11), the week prior to the F<sub>1b</sub> mating (week 21) and at termination of the generation (week 30), by one-way analysis of variance and Bartlett's test for homogeneity of variances. Treatment groups were compared to the control group using the appropriate t-statistic (for equal or unequal variances) as described by Steel and Torrie<sup>1</sup> and Ostle<sup>2</sup>. Significant differences were determined using Dunnett's<sup>3</sup> multiple comparison tables.

**b. Male and Female Fertility**

Male and female fertility indices were compared using the Chi-square test criterion with Yates' correction for 2 x 2 contingency tables and/or Fisher's exact probability test as described by Siegel<sup>4</sup> to judge levels of significant differences.

15

*International Research and Development Corporation*

## c. Pup Survival Indices

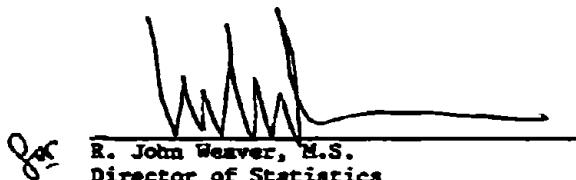

The proportion of live pups at birth per total number born and the survival indices at lactation days 4, 7, 14 and 21 were compared by the Mann-Whitney U-test as described by Siegel<sup>4</sup> and Weil<sup>5</sup> to judge significant differences.

## d. Litter Size and Pup Body Weights

The mean numbers of liveborn pups per litter and mean body weights of pups were analyzed by one-way analysis of variance and Bartlett's test for homogeneity of variances. Treatment groups were compared to the control group using the appropriate t-statistic (for equal or unequal variances) as described by Steel and Torrie<sup>1</sup> and Ostle<sup>2</sup>. Significant differences were determined using Dunnett's<sup>3</sup> multiple comparison tables.

## B. RESULTS

The results of the data analyses are discussed in the appropriate sections of the report.

VI. IN-LIFE PHASE

A. METHODS

1. Experimental Design

a. Animal Receipt and Environmental Conditions

Eighty-one male and 160 female 42-day old Charles River COBS® CD® rats were received from The Charles River Breeding Laboratories, Inc., Portage, Michigan on October 5, 1982. Upon receipt, the animals were assigned temporary animal numbers and housed individually in suspended wire-mesh cages.

During the 14-day acclimation period, the rats were provided with basal laboratory diet of ground Purina® Certified Rodent Chow® #5002 (each diet lot used was recorded) and tap water available ad libitum and carefully observed for changes in appearance and behavior. Throughout the study, all animals were housed in environmentally controlled rooms. Temperature ranged between 21 and 24°C. Generally, humidity was within 50  $\pm$  15%, however, protocol humidity requirements were exceeded five times during the course of the study. Fluorescent lighting provided illumination 12 hours per day. Rats were housed individually in suspended wire-mesh cages except during mating (when rats were cohabitated), gestation and lactation when females were housed in plastic breeding cages with wood shaving bedding. Feeder jars were changed and sanitized once weekly.

Rats were identified by cage, group and individually by a Monel® metal ear tag. The individual animal number plus the IRDC study number comprised a unique identification number for each animal.

b. Organization of Test Groups

Animals exhibiting physical abnormalities were discarded prior to randomization. At study initiation, animals were randomly assigned (see Section V.A.1) to one control and three treatment groups consisting of 15 males and 30 females each to become the F<sub>0</sub> parents.

The study schematic is presented in Figure 1.

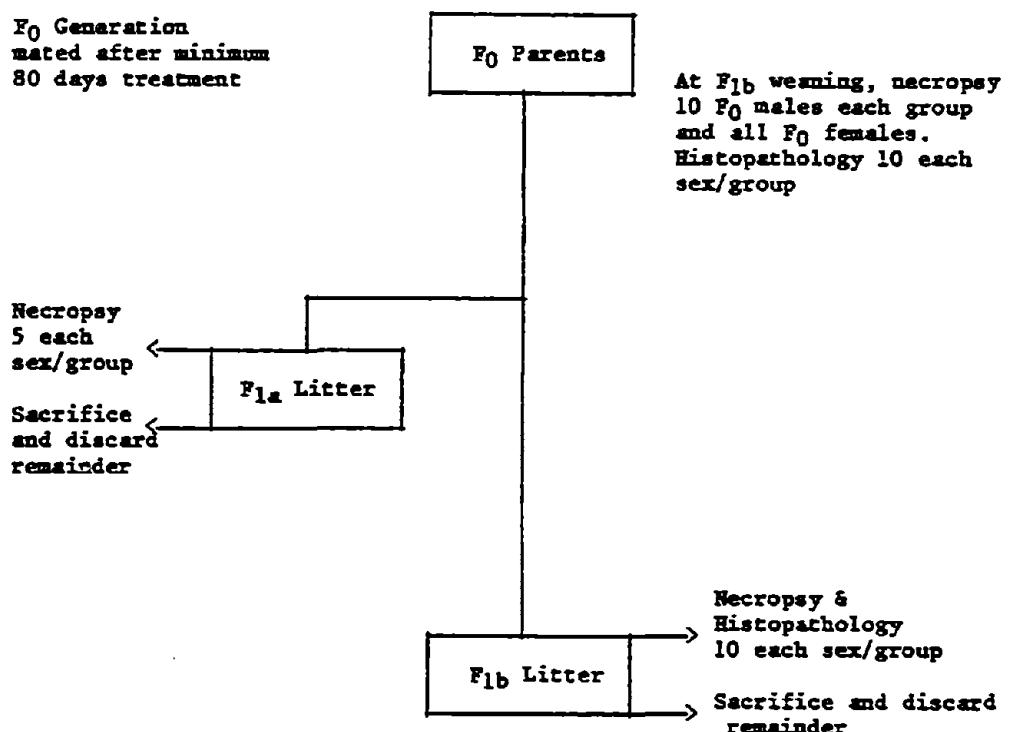

81

---

F<sub>0</sub> Generation  
mated after minimum  
80 days treatment

Study Schematic

8/8

*International Research & Development Corporation***2. General Observations****a. General Appearance, Behavior and Mortality**

The parental rats and pups were observed twice each day for signs of overt toxicity, changes in general appearance and behavior, and mortality. Detailed observations were recorded weekly on the parental rats. On study week 6, detailed observations were inadvertently not recorded for all animals. Examination of pups for gross deformities was conducted at birth and on days 4, 7, 14 and 21 of lactation.

**b. Body Weights**

Individual body weights were recorded weekly for the adult rats. In addition, females were weighed on days 0, 7, 13 and 20 of gestation and days 0, 7, 14 and 21 of lactation for all matings. Pups were individually weighed on days 0, 4, 7, 14 and 21 of lactation.

**c. Food Consumption**

Parental food consumption was measured weekly for individual rats except during mating. Food consumption was not measured during mating as the males and females were cohabitated during this time period.

**d. Estrous Cycle Determinations**

Ten days prior to initiation of each mating period, the F<sub>0</sub> females were smeared daily to establish estrous cycles. Smearing continued until evidence of mating was determined or until the mating period ended.

**e. Reproductive and Litter Parameters**

Specific reproductive observations included tabulation of male and female fertility indices and the length of gestation. Any abnormalities in nesting and nursing behavior and difficulties at parturition were recorded. Litter parameters assessed included mean number of live and stillborn pups per litter (litter size), pup survival to weaning, pup weight at birth and specified intervals (see Section VI.A.2.b.) during lactation and general appearance and behavior.

*AB**International Research & Development Corporation*

---

**3. Specific Breeding and Maintenance Schedule****a. First Generation - First Breeding ( $F_{1a}$  Offspring)**

After a minimum of 80 days of treatment (136 days of age), the  $F_0$  parental rats were mated to produce the  $F_{1a}$  offspring as follows: Initially, the  $F_0$  animals were individually housed in suspended wire-mesh cages. Each male was cohabitated with two females from the same treatment group and this mating set was placed in a plastic cage with wood shaving bedding for a period of 10 days. The females were examined daily for evidence of copulation by means of vaginal smears and/or the appearance of a vaginal plug. The day evidence of copulation was established was designated as gestation day 0 and the female was transferred to an individual plastic cage containing nesting material (wood shaving bedding). Any females failing to exhibit evidence of mating after the initial 10-day mating period were remated with a different male (sperm positive during initial 10 days) selected from the same treatment group for a five-day period. The maximum mating period was 15 days. After the mating period, males were returned to individual suspended wire-mesh cages and maintained on treatment. Females for which no evidence of copulation was detected after the 15-day mating period were individually housed in plastic cages with wood shaving bedding. A record of mating performance was maintained and both male and female fertility indices were tabulated.

Toward the end of the gestation period, females were examined twice daily for signs of parturition. The bred females were allowed to give birth ( $F_{1a}$ ). The length of gestation was calculated and any difficulties occurring at delivery were recorded. The day on which all pups had been delivered was designated day 0 of lactation. The litters were examined as soon as possible after delivery for litter size, stillbirths, live births and any gross abnormalities. Litter

8A

*International Research & Development Corporation*

---

size was reduced to 10 pups, of equal sex distribution whenever possible, on lactation day 4 by use of a random numbers table. The culled pups were examined externally and discarded. Litters were caged with their mothers for three weeks after birth. Dams and pups were observed daily for survival and behavioral abnormalities in nesting and nursing; the presence of dead pups was recorded. Intact dead pups were necropsied, examined for anomalies and discarded. Dams and pups were weighed during gestation and/or lactation as previously described. The number of pups per sex was recorded on day 21 of lactation. At weaning, 5 male and 5 female F<sub>1a</sub> pups randomly selected from each group were sacrificed and necropsied. An additional female pup (six total) from the 0.005 mg/kg/day group was inadvertently sacrificed and necropsied. All other F<sub>1a</sub> pups were sacrificed and discarded after a gross external examination at weaning.

b. First Generation - Second Breeding (F<sub>1b</sub> Offspring)

Because of the reduced fertility observed in all groups, the study was extended for production of a second litter (F<sub>1b</sub>) by the F<sub>0</sub> parents. All F<sub>0</sub> males and females remained on study and continued on treatment after the F<sub>1a</sub> pups were weaned.

The F<sub>0</sub> females were rested for a minimum of 10 days after completion of the initial 21-day lactation period and then bred a second time with a different male in the same treatment group to produce the F<sub>1b</sub> litters. The rats had been treated for a minimum of 132 days prior to the F<sub>1b</sub> mating. Methodology and observations during mating, gestation and lactation were identical to those utilized for the F<sub>1a</sub> mating.

At the completion of the F<sub>1b</sub> 21-day lactation period, all dams and 10 male/10 female F<sub>1b</sub> pups randomly selected from each group were sacrificed and necropsied. Uterine implantation sites of the dams were recorded. All other pups were examined externally, sacrificed and discarded. Also, 10 randomly selected F<sub>0</sub> males from each group and

SAC

*International Research & Development Corporation*

---

those females that did not deliver litters were sacrificed and necropsied. Uteri were stained with ammonium sulfide solution for detection of implantations<sup>2</sup>. The remaining F<sub>0</sub> males were externally examined, sacrificed and discarded.

#### B. RESULTS

##### 1. General Appearance, Behavior and Survival

###### a. F<sub>0</sub> Parental Rats

Mortality of F<sub>0</sub> parental rats is illustrated in Figure 2.

Figure 2. <sup>F<sub>0</sub> Parental Mortality</sup>  
Elemental Phosphorus mg/kg/day

	<u>0</u>	<u>0.005</u>	<u>0.015</u>	<u>0.075</u>
Males	1/15	2/15 <sup>a</sup>	0/15	0/15
Females	4/30	1/30	1/30	15/30

<sup>a</sup>Value includes one male sacrificed in extremis.

Upon necropsy, evidence of technical error in gavaging was indicated as the cause of death in two animals, one female (17952) in the control group and one male (17964) in the 0.005 mg/kg/day treatment group. There was no evidence of intubation error among the remaining F<sub>0</sub> parents that died on study.

One death occurred among the F<sub>0</sub> males in the control group during week 16. Although the animal (17927) exhibited no visible abnormalities prior to death, the cause of death was attributed to cystitis. One F<sub>0</sub> male (17972) in the 0.005 mg/kg/day dosage group was sacrificed in extremis during week 8. Prior to sacrifice, this rat displayed clinical signs that included gasping, loss of righting reflex, hypothermia, and moribundity. Necropsy observations consisted of yellow-to-white lesions on the kidneys, white fluid in the kidneys and enlarged kidneys.

Mortality among F<sub>0</sub> females first occurred during week 14. The majority of F<sub>0</sub> females that died on study displayed no visible

8/6

*International Research & Development Corporation*

abnormalities prior to death. The predominant clinical sign observed was hair loss on both forelimbs, primarily confined to the 0.075 mg/kg/day treatment group, and was considered a result of nesting behavior. However, at the 0.075 mg/kg/day treatment level, seven females in the F<sub>1a</sub> and six females in the F<sub>1b</sub> matings died on gestation days 21 or 22; this may have resulted from difficulties in parturition.

Postmortem examination revealed that one F<sub>0</sub> female in the high-dose group (18094) died due to a rupture of the uterine wall during delivery. With the exception of this and the previously mentioned control female that died of gavage injury, the cause of death could not be determined for the remainder of F<sub>0</sub> females that died on study.

The majority of animals that survived to study termination exhibited no visible abnormalities. The most frequently noted clinical sign was hair loss, which was observed primarily among females. As previously stated, this was considered a result of nesting behavior. Misaligned upper incisors with or without a corresponding dry material around the eyes was observed in a few animals in each group but this is a common observation in this species and not considered treatment related.

There were no meaningful differences in necropsy observations between control group rats and those in the treatment groups that survived to study termination. Necropsy observations consisted primarily of no gross lesions, with a few isolated incidents of renal pelvic dilation, tan foci on the liver and enlarged uterus.

## 2. Parental Body Weights (Tables 2-5, Appendices C and D)

Weekly group mean body weight values for males in the high dose group were generally comparable to the control group values during the first half of the generation but were very slightly decreased during the second half. Low- and mid-dose male weekly values were slightly to moderately less than those of the control throughout the generation.

*SA*

---

*International Research & Development Corporation*

---

There was no clear dose-relationship in the pattern of body weight inhibition among F<sub>0</sub> males. The F<sub>0</sub> female mean weekly body weight values of the treated groups did not differ meaningfully from those of the control throughout the generation.

There were no meaningful differences in group mean maternal body weight changes between the control group values and those of the treatment groups during the F<sub>1a</sub> and F<sub>1b</sub> overall gestation periods. Group mean maternal body weights of the treatment groups were comparable to those of the control group throughout both the F<sub>1a</sub> and F<sub>1b</sub> lactation interval. Slight losses in group mean maternal body weight were occasionally observed in the control and all treatment groups during the F<sub>1a</sub> and F<sub>1b</sub> lactation periods, but these are common in this species during lactation and were not considered meaningful.

3. Food Consumption (Tables 6, 7)

The mean food intake values (g/animal/day and g/kg/day) of treated parents of both sexes were comparable to those of the control throughout the study.

4. Reproductive Parameters (Tables 8 and 9, Appendices B, E, F and G)

a. Fertility

Male and female fertility indices were comparable to the control group values at all treatment levels in the F<sub>1a</sub> and F<sub>1b</sub> matings. Evaluation of daily estrous examinations prior to and during the F<sub>1a</sub> and F<sub>1b</sub> matings did not indicate a treatment effect. Occasional irregularities (primarily prolonged estrous and post-estrous) were observed at roughly similar frequencies in the treated and control groups.

b. Parturition and Length of Gestation

There were no significant differences in the mean length of gestation between the treatment group females and those in the control group in the F<sub>1a</sub> and F<sub>1b</sub> matings. At the high-dose level, seven F<sub>1a</sub> and

*89*

---

*International Research & Development Corporation*

---

six F<sub>1b</sub> dams died during the period of expected parturition (days 21 or 22 of gestation). This finding was considered indicative of treatment-induced dystocia. There was no evidence of parturition difficulties in females in the control, 0.005 or 0.015 mg/kg/day groups.

5. Litter Parameters (Tables 8 and 9, Appendices E and G)

a. Pup Viability (birth)

Slight reductions in the mean number of viable pups at birth in the F<sub>1a</sub> litters were observed at the 0.075 mg/kg/day level; there was a concurrent increase in the mean number of stillborn pups. Also the pup survival index at lactation day 0 for the 0.075 mg/kg/day dosage group was reduced when compared to the control group value.

Similar findings were noted in the mean numbers of viable and stillborn pups at 0.075 mg/kg/day in F<sub>1b</sub> litters, but not at similar magnitudes as the F<sub>1a</sub> litter values. Survival index values for the 0.075 mg/kg/day in F<sub>1b</sub> litters were comparable to those of the control.

There were no biologically or statistically significant differences between the 0.005 or 0.015 mg/kg/day treated rats and the control rats in the mean number of viable or stillborn pups on lactation day 0 in the F<sub>1a</sub> and F<sub>1b</sub> litters.

b. Pup Survival to Weaning

Treatment with elemental phosphorus at levels of 0.005, 0.015 and 0.075 mg/kg/day had no apparent effect on pup survival to weaning in the F<sub>1a</sub> or F<sub>1b</sub> litters. Three F<sub>1b</sub> litters were sacrificed after the death of their dams during the lactation period. The sacrificed pups were excluded from the survival indices.

c. Pup Weight at Birth

The mean pup weight at birth of treated litters in both matings of the F<sub>0</sub> generation was statistically comparable to that of the control group.

## *International Research & Development Corporation*

---

### d. Pup Weights During Lactation

Pup body weights during lactation were unaffected by treatment with elemental phosphorus at dosage levels of 0.005, 0.015 and 0.075 mg/kg/day in both matings of the F<sub>0</sub> generation.

### e. Offspring Assessment

There were no physical or behavioral abnormalities associated with treatment with elemental phosphorus observed in pups at the 0.005, 0.015 or 0.075 mg/kg/day levels when compared to control pups. In the F<sub>1a</sub> litters, 47 pups died and were necropsied; seven, nine, fourteen and seventeen in the control, 0.005, 0.015 and 0.075 mg/kg/day groups, respectively. Anomalies were observed in two control group pups (one male, one female) at necropsy. The female displayed mandibular micrognathia; one centrally located, larger than normal, nares opening; oral opening absent, one facial papillae absent, pinna placed more ventral than normal; microphthalmia of the left eye and a cleft palate. The male pup exhibited a right-sided aortic arch, the pulmonary trunk was more narrow than normal, the ductus arteriosus emptied into the left subclavian, a vestigial vessel was retroesophageal (arose from the descending aorta and entered the area where the ductus arteriosus emptied into the left subclavian) and an interventricular septal defect. Also, all lobes of the lungs were reversed with two lobes present on the right side and three lobes present on the left side.

Variations present in F<sub>1a</sub> pups that died consisted of Grade 0 kidney (agenesis of the renal papillae) in one female in the 0.005 mg/kg/day group. Necropsy findings observed in the remainder of dead F<sub>1a</sub> pups were primarily indicative of postmortem autolytic changes.

Sixteen F<sub>1a</sub> pups, four, six, four and two in the control, low-, mid- and high-dose groups, respectively, were either missing and presumed completely cannibalized, or partially cannibalized and discarded without necropsy.

*International Research & Development Corporation*

The appearance and behavior of  $F_1b$  pups at 0.005, 0.015 and 0.075 mg/kg/day was also comparable to that of the control group pups. In the  $F_1b$  litters, 31 pups died and were necropsied; three, eight, eleven and nine in the control, 0.005, 0.015 and 0.075 mg/kg/day groups, respectively.

Malformations were observed in one male pup from the 0.015 mg/kg/day group. The abnormalities consisted of mandibular micrognathia (short lower jaw), microstomia, three facial papillae absent, both pinnae located more ventral and posterior than normal and cleft palate.

Variations and pathological findings consisted of Grade 0 kidneys in one male pup in the control group, and one male pup in the 0.075 mg/kg/day group exhibited a pericardium filled with dark red clotted material and fluid, and a large tear and red clotted material on the left atrium. All other dead pups in the  $F_1b$  litters were determined to be normal or had normal autolytic changes.

Three litters, one in the control group and two in the 0.075 mg/kg/day group, were examined and discarded following the death of their dams. Each of these litters consisted of 10 pups each. Of these 30 pups, all were normal except one male from one of the 0.075 mg/kg/day litters. This male pup displayed hydronephrosis which was considered a pathological finding.

Twelve  $F_1b$  pups, four, four, two and two in the control, low-, mid- and high-dose groups, respectively, were either missing and presumed completely cannibalized, or partially cannibalized and discarded without necropsy being performed.

## VII. PATHOLOGY

### A. METHODS

#### 1. Macroscopic

Complete postmortem examinations, under the direct supervision of a pathologist, were performed for 10 F<sub>0</sub> parental males per group, all F<sub>0</sub> parental females, all F<sub>0</sub> females which did not deliver litters, 10 F<sub>1b</sub> pups per sex per group, 5 F<sub>1a</sub> pups per sex per group (except Group 2 female which had six) and all died on study and sacrificed in extremis animals. All survivors and all animals sacrificed in extremis were euthanized by carbon dioxide asphyxiation.

After a thorough external examination, each animal was opened and the contents of the abdominal, thoracic and cranial cavities were examined both in situ and after removal and dissection. All macroscopic abnormalities were recorded on the Pathology Record sheet.

Representative samples of protocol designated tissues were collected and placed in phosphate-buffered neutral formalin. Tissues were collected from 10 F<sub>0</sub> parents per sex per group, 10 F<sub>1b</sub> pups per sex per group and gross lesions from all died on study and sacrificed in extremis animals. The following tissues were collected:

- Adrenal (2)
- Aorta (abdominal)
- Bone (femur)
- Bone marrow (femur)
- Brain (2 levels)
- Esophagus
- Eye (2) (including optic nerve and Harderian gland, right).
- Heart
- Ileum
- Jejunum
- Cecum
- Rectum
- Colon
- Mammary gland (inguinal)
- Nerve (sciatic)
- Ovary (2)
- Pancreas
- Pituitary
- Prostate/seminal vesicle (2)
- Salivary gland
- Skeletal muscle (biceps femoris, right)
- Skin (inguinal, taken with mammary gland)
- Spleen
- Spinal cord (cervical)
- Stomach
- Testis (with epididymis) (2)

9/3

*International Research & Development Corporation*

---

- Duodenum
- Kidney (2)
- Liver (sections from at least 2 lobes)
- Lung (with mainstem bronchi) (2)
- Lymph nodes (mesenteric)
- Thymus
- Thyroid (with parathyroid)
- Trachea
- Urinary bladder
- Uterus (corpus with cervix uteri)
- Gross lesions

2. Microscopic

Representative samples of protocol designated tissues were processed for the preparation and microscopic examination of hematoxylin-and-eosin-stained paraffin sections. A full tissue complement was prepared for 10 F<sub>0</sub> parents per sex from the high-dose and control groups, 10 F<sub>1b</sub> pups per sex from the high-dose and control groups and gross lesions from animals which died on study or were sacrificed in extremis. A four-step grading system of trace, mild, moderate, and severe was used to define gradable lesions for comparison between dosage groups. A complete listing of tissue accountability can be found in the Tissue Inventory (Appendix J).

The following list constitutes the full complement of tissues:

- Adrenal (2)
- Bone
- Brain
- Heart
- Kidney (2)
- Liver
- Lung (with mainstem bronchi)
- Ovary (2)
- Prostate/seminal vesicle (2)
- Stomach
- Testis (with epididymis) (2)
- Uterus (corpus with cervix uteri)
- Gross lesions

B. Results

1. Macroscopic (Tables 10-15, Appendix I)

There were no compound-related changes observed during postmortem examination of animals from the F<sub>0</sub>, F<sub>1a</sub> or F<sub>1b</sub> generations. All changes observed were considered incidental and unrelated to the compound.

*QH*

*International Research and Development Corporation*

---

2. Microscopic (Tables 16-19, Appendices I and J)

There were no compound-related changes observed during microscopic examination of tissues from animals in the F<sub>0</sub> or F<sub>1b</sub> generations. All changes observed were considered incidental and unrelated to the administration of the compound.

Microscopic tissue examinations were performed by Linda C. Uraih, D.V.M., M.S. Dr. Uraih is no longer employed at IRDC.

Values from the treated groups, specified to be treated in the report, did not differ significantly from the control group, p>0.05.  
<sup>a</sup>Dams #17983 (0.005 mg/kg/day) and #18067 (0.075 mg/kg/day) died on gestation days 1 and 5, respectively. Pregnancy status could not be determined for either female, therefore they were not included in the female fertility calculations for their respective groups.  
<sup>b</sup>Value does not include pups sacrificed due to death of dam(s).

**APPENDIX H**  
**Personnel Involved in the Study**

The following list of people were responsible for the supervision of various phases of this study:

Dale Aldridge, B.S.	Unit Supervisor, Report Writing, Reproduction and Teratology
Stephen Allen, B.S.	Unit Supervisor, Test Material Control
Carol Bajo	Group Supervisor, Reproduction and Teratology
Malcolm Blair, Ph.D.	Director of Toxicology Division
Dixie K. Bushee, B.S.	Unit Supervisor, Test Material Control
Serena Cole, B.A.	Unit Supervisor, Reproduction and Teratology
Mark W. Griggs, B.S.	Group Supervisor, Test Material Control
Joan Honeysett, B.A.	Unit Supervisor, Reproduction and Teratology
Jacqueline M. Leng, B.S.	Report Writer, Reproduction and Teratology
Ward R. Richter, D.V.M. A.C.V.P.	Director of Pathology Division
James L. Schardein, M.S.	Director of Reproduction and Teratology
Colleen A. Schwartz	Assistant to the Director, Reproduction and Teratology
Yolanta Sochanek, B.S.	Unit Supervisor, Reproduction and Teratology
Roger Terry, B.S.	Group Supervisor, Reproduction and Teratology
Joseph H. Thorstenson, Ph.D	Director of Analytical Chemistry
Patrick E. Traster, B.S.	Director of Laboratory Services
Linda C. Uraih, D.V.M., M.S.	Staff Pathologist
Robert E. Vollmar, M.S.	Director of Statistics and Computer
R. John Weaver, M.S.	Biostatistician, Statistics and Computer

Protocol Sheet No. 2 Study No. 401-189 (IR-82-215)

TITLE: ONE GENERATION REPRODUCTION STUDY IN RATS WITH ELEMENTAL PHOSPHORUS

---

Page 1 of 2

<u>ITEM</u>	<u>JUSTIFICATION</u>
1	Due to the reduced fertility observed in all groups, the study will be extended for production of a second litter ( $F_{1b}$ ) by the $F_0$ Parents.
2	Mating, gestation and lactation procedures for production of $F_{1b}$ litters.
3	Revised study termination procedures.
4	Revision of histopathology evaluation of pups.
5	Study schedule revision.

---

<u>ITEM</u>	<u>PROTOCOL REVISION OR CLARIFICATION</u>
1	All $F_0$ males and females will remain on study and continue on treatment after the $F_1$ pups (hereafter described as $F_{1a}$ pups) are weaned for production of a second litter ( $F_{1b}$ ).
2	Ten days after completion of the $F_{1a}$ weaning period, the $F_0$ females will be bred a second time to produce the $F_{1b}$ litters. Each mating will be with a different male within the same treatment group. All observations and measurements previously described for the $F_0$ parents and $F_{1a}$ pups will subsequently be made during gestation and lactation of the $F_{1b}$ litters.

PROTOCOL REVISION OR CLARIFICATION

3

At weaning, all F<sub>0</sub> dams and 10 male and 10 female F<sub>1b</sub> Pups randomly selected from each group will be sacrificed and necropsied at weaning. At the completion of the F<sub>1b</sub> weaning period, 10 randomly selected F<sub>0</sub> males from each group and F<sub>0</sub> females not delivering litters will be sacrificed and necropsied. Specific evaluations at necropsy will be conducted as directed in Section XVI.D. of the protocol. Tissues will be preserved from the above F<sub>0</sub> (10/sex/group) animals and evaluated as described in Section XVI.E.2. of the protocol. Tissues will also be preserved from the F<sub>1b</sub> pups (10/sex/group) for possible histopathology.

4

The tissues and organs of the F<sub>1a</sub> (previously designated as F<sub>1</sub>) and F<sub>1b</sub> pups preserved at necropsy will not be examined histopathologically at this time. The Sponsor will make a decision at a later date which of the two litters will be evaluated.

I. STUDY TITLE

One Generation Reproduction Study in Rats with Elemental Phosphorus

II. PURPOSE OF THE STUDY

The objective of this study is to determine the effect of the test article on fertility, parturition, neonatal viability, growth of the newborn and reproductive performance in rats. The study design utilizes treatment of both sexes.

III. STUDY NUMBER

IV. TESTING FACILITY

International Research and Development Corporation  
Mattawan, Michigan 49071

V. SPONSOR

Monsanto Chemical Company  
800 North Lindbergh Boulevard  
St. Louis, Missouri 63166

VI. SPONSOR'S REPRESENTATIVE

Dr. Rashmi Nair

VII. IRDC PERSONNEL RESPONSIBILITIES

Study Director:

James L. Schardein, M.S.  
Director of Reproduction and  
Teratology

Malcolm Blair, Ph.D.

Director of Toxicology Division:  
Associate Director of Toxicology

Dale E. Johnson, Pharm.D., Ph.D.

Director of Statistics & Computer:

Ward R. Richter, D.V.M., M.S.,

Director of Pathology Division:

A.C.V.P.

VIII. SCHEDULE

Proposed Starting Date of Study: September, 1982

Proposed Completion Date of Study: February, 1983

Proposed Date of Final Report:

2925

**IX. TEST ARTICLE DATA (To be supplied by Sponsor)**

- A. Identification: Phosphorus (yellow); IRDC 7481B
- B. Lot Number: Fisher 701628
- C. Batch Number:
- D. Physico-Chemical Properties:
- E. Purity:
- F. Shelf Life:
- G. Storage Conditions: Phosphorus is shipped and stored in accordance with DOT regulations (see attached information).
- H. Safety Precautions: Phosphorus is a flammable solid and is considered hazardous.

**X. TEST ARTICLE PREPARATION**

**A. Dosage Concentrations**

Based on data supplied by the Sponsor a stock solution will be prepared for dilution to deliver the stated dosages. Preparation of the solution and the analytical method for determination of phosphorus in prepared test solutions is outlined in Appendix I.

Stock and dosing solutions will each be prepared in separate batches as required since the stability of phosphorus in corn oil has been established as at least 17 days by the Sponsor. The prepared test solutions will be stirred overnight using a magnetic stir plate and bars and analyzed 24 hours after preparation to allow for complete dissolution of the phosphorus. Prior to administration to the test animals, samples from each level and batch will be analyzed in duplicate. Assay values which deviate from normal expected ranges (Table 3, Appendix I) will be considered out of tolerance and will not be administered to the animals. A replacement solution will be prepared immediately and analyzed.

**B. Dosage Preparation**

The test article will be given in corn oil at a constant volume of 5 ml/kg. The control group will be given corn oil only at a volume of 5 ml/kg.

393

XI. TEST ANIMALS

- A. Species: Rat
- B. Strain: Charles River COBS® CD®
- C. Source: The Charles River Breeding Laboratories, Inc.  
9801 Shaver Road  
Portage, Michigan 49081
- D. Age at Start of Study: Approximately 6-7 weeks of age at receipt;  
56 days of age at initiation of dosing.
- E. Body Weight at Start of Study: Males: approximately 225-250 g  
Females: approximately 175-200 g
- F. Method of Identification: Each parental rat will be identified by cage, group and individually by a monel metal ear tag bearing its animal number. The individual animal number plus the IRDC project number will comprise a unique identification number for each animal.
- G. Number on Study: 60 males and 120 females
- H. Reason for Selection: The rat is an acceptable model for reproduction studies. This laboratory has historical control data on the fertility, neonatal survival indices and growth rates and the reproductive performance in rats of this strain from this source.

XII. STUDY DURATION

The duration of the entire study from initiation of treatment in the males through lactation of the pups is approximately 4½ months. A study schedule will be issued prior to study initiation that will include the following information: dates for animal arrival, mating initiation and termination, administration of the test and control articles (initiation and termination), parturition, lactation and sacrifice.

XIII. ROUTE OF ADMINISTRATION

Oral.

Reason for Use: One of the potential routes of exposure to humans is oral.

#### XIV. METHOD AND FREQUENCY OF ADMINISTRATION OF THE TEST ARTICLE

Gavage. Animals will receive the test article by gavage as a single daily dose. It will be administered in corn oil at a constant volume of 5.0 ml/kg/day. Administration of both the test and control articles (corn oil) to both sexes will begin 90 days prior to mating. In males dosing will continue until sacrifice. Administration in the females will continue through gestation and weaning of the pups. Individual dosages will be based on the most recent weekly body weights.

#### XV. EXPERIMENTAL DESIGN

##### A. Animal Conditioning and Selection

Approximately 150 female and 75 male Charles River COBS® CD® rats will be removed randomly from the shipping cartons and housed for a minimum 10 day acclimation period. During this conditioning period, the rats will be observed daily for any clinical signs of disease and all animals will be given a detailed physical examination just prior to study initiation. All rats with any evidence of disease or poor physical condition will be discarded. Animals considered suitable for study will be randomly selected and divided into the groups indicated using the procedure described in Section XV.C.

##### B. Housing

All animals will be housed in an environmentally controlled room with an average temperature of  $23 \pm 2^{\circ}\text{C}$  and average humidity of  $50 \pm 15$  percent. Fluorescent lighting will provide illumination 12 hours per day. During the study, rats will be housed individually in suspended wire-mesh cages except during mating, gestation and lactation. On gestation day 0, the females will be housed in plastic cages with wood shaving bedding until sacrifice.

##### C. Randomization (Procedure A)

Animal numbers and corresponding body weights are entered onto magnetic tape which is used as the data source for the randomization procedure. The mean body weight and standard deviation are calculated by sex and a computer-generated edit develops a listing of those animals whose body weights are within  $\pm 1.5$  standard deviations of the mean. From the qualifying animals, the randomization procedure selects and assigns the required number of animals. Bartlett's Chi-square test for homogeneity of variances is applied to the groups. If the groups are not judged to be homogeneous, new randomizations are applied until homogeneity is established.

3795

XV. EXPERIMENTAL DESIGN (continued)D. Dosage Levels

Group Number	Number of Parental Animals		Dosage Level (mg/kg/day)
	Males	Females	
1	15	30	0 (Vehicle Control)
2	15	30	Low Dose
3	15	30	Mid Dose
4	15	30	High Dose

E. Basal Laboratory Diet

1. Basal Diet: Certified Rodent Chow® #5002, Ralston Purina Company. Diet will be available ad libitum to all animals.
2. Identification: Each lot utilized will be identified and recorded.
3. Contaminant Levels: The diet used will be a certified diet with specified analyses for contaminants performed by the supplier.

F. Drinking Water

The drinking water used for test animals at IRDC will be monitored for contaminants at periodic intervals according to IRDC Standard Operating Procedures. Water will be available ad libitum for all animals.

XVI. OBSERVATIONS AND EXAMINATIONSA. Parental Observations

1. Signs: All parental animals will be observed for mortality and signs of overt toxicity twice each day (morning and afternoon), seven days a week. Should mortality or such signs of overt toxicity be observed, these will be recorded on the day observed. Examples of overt toxicity include tremors, convulsions, loss of righting reflex, excessive blood loss and moribundity. An exception to this would be a recurring, frequently observed reaction for which a general statement will suffice. During treatment, a detailed clinical observation of each animal will be performed weekly and the findings recorded.

396-

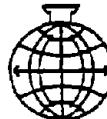

XVI. OBSERVATIONS AND EXAMINATIONS (continued)

2. Body Weights: Males and females will be weighed weekly during treatment until sacrifice. Females will also be weighed on gestation days 0, 7, 13 and 20 and on days 0, 7, 14 and 21 of lactation.
3. Food Consumption: Individual food consumption will be measured for all parental animals weekly except during the mating period when the animals will be cohabitating.
4. Mortality: Any rat showing signs of severe debility or toxicity, particularly if death appears imminent, will be killed to prevent loss of tissues through autolysis. All rats killed in extremis or found dead will be subjected to a routine necropsy procedure. The disposition of all animals and intact fetuses or pups is described in Section XVI.E.
5. Estrous Cycle Determinations: Ten days prior to mating and until evidence of copulation is observed or the mating period has ended, the females will be smeared daily to establish estrous cycles.

B. Breeding Procedures

Sexually mature male and female rats will be acclimated in this laboratory for a minimum of 10 days prior to study initiation. All rats will be randomly assigned by a computer-generated program to three treatment groups and one control group of 15 males and 30 females each and properly identified by ear tag.

After 80 days of exposure to the F<sub>0</sub> animals one male will be housed with two females of the same treatment group in a plastic cage with wood shaving bedding for mating. The occurrence of copulation will be established by daily inspection for a copulatory plug or vaginal smear for sperm. A positive finding is considered day "0" of gestation. Each female is then returned to an individual plastic cage. The maximum mating period will be 15 days. If no evidence of copulation is obtained in 10 days, the female will be placed with another male (sperm positive in the initial 10 days) in the same treatment group for the remaining 5 days. After the 15-day mating period the males will be returned to suspended wire-mesh cages until sacrifice. At this time, females with no evidence of mating will be housed individually and provided nesting material.

L26

XVI. OBSERVATIONS AND EXAMINATIONS (continued)C. Delivery

All females from each group will be allowed to deliver. Toward the end of the gestation period, females will be examined twice daily for signs of parturition. The bred females will be allowed to give birth ( $F_1$ ). The duration of gestation will be calculated and any difficulties occurring at parturition will be recorded. The day on which all pups have been delivered will be defined as day 0 of lactation. The litters will be examined as soon as possible after delivery for litter size, stillborns, live births and any gross anomalies. Litter size will be reduced to 10 pups, of equal sex distribution whenever possible, on lactation day 4. The culled pups will be examined externally and discarded. Litters will be caged with their mothers for 3 weeks after birth. The dams and pups will be observed daily for survival, behavioral abnormalities in nesting and nursing and presence of dead pups will be recorded.

Any intact dead pups found will be necropsied, examined for anomalies and discarded. The heart will be dissected by a modification of the method described by Staples<sup>1</sup>. Pups will be weighed individually on days 0, 4, 7, 14 and 21 of lactation. The number of pups per sex will be recorded on day 21 of lactation.

D. Termination of the Study

Unless otherwise specified by the Sponsor prior to this time, all dams and 10 male/10 female  $F_1$  pups randomly selected from each group will be sacrificed and necropsied at weaning. Uterine implantation sites of the dams will be recorded. If abnormalities are noted in any pup at weaning, these pups will also be necropsied. All other pups will be examined externally, sacrificed and discarded.

At the completion of the weaning period, 10 randomly selected males from each group and females not delivering litters will be sacrificed and necropsied. Uteri will be stained with ammonium sulfide solution to determine pregnancy. If there is no evidence of reduced fertility, the remaining males will be externally examined, sacrificed and discarded at this time.

Tissues will be saved from the above  $F_0$  parental animals and  $F_1$  pups as directed in Section XVI.E.2.

---

<sup>1</sup>Staples, R. E. (1974). Detection of visceral alterations in mammalian fetuses. Teratology, 9: A37-A38.

899

XVI. OBSERVATIONS AND EXAMINATIONS (continued)E. Pathology

1. Animals Dying on Test or Sacrificed in Extremis: A gross necropsy will be performed on all rats not surviving to scheduled sacrifice in an attempt to determine the cause of death. The fetuses from dams dying during gestation will be examined externally to the fullest possible extent and discarded. Pups from dams which die during the lactation period will be externally examined, sacrificed and necropsied.

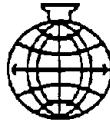

The thoracic and abdominal cavities and organs of the animals will be examined for grossly evident morphological changes and the carcasses discarded. Tissues from the rats will be discarded except for macroscopic lesions which will be saved in neutral buffered formalin for histopathological examination.

2. Histopathology: The following tissues and organs from animals specified below will be preserved at necropsy in 10% neutral buffered formalin. Underlined tissues will be examined microscopically for the high dose and control groups.

1. F<sub>0</sub> parental animals - 10/sex/group

2. F<sub>1</sub> pups - 10/sex/group

### XVII. STATISTICAL ANALYSIS

All statistical analyses will compare the treatment groups to the control group with the level of significance at  $p < 0.05$  and  $p < 0.01$ .

The male and female fertility indices will be compared using the Chi-square test criterion with Yates' correction for  $2 \times 2$  contingency tables and/or Fisher's exact probability test as described by Siegel<sup>2</sup> to judge significance of differences. Pup survival indices will be compared by the Mann-Whitney U-test as described by Siegel<sup>2</sup> and Weil<sup>3</sup> to judge significance of differences.

Parental body weights (at week prior to mating and at termination of generation), mean number of live pups per litter at birth and mean pup body weights taken on lactation days 0, 4, 7, 14 and 21 will be compared by analysis of variance (one-way classification), Bartlett's test for homogeneity of variances and the appropriate t-test (for equal and unequal variances), as described by Steel and Torrie<sup>4</sup> using Dunnett's multiple comparison tables<sup>5</sup> to judge significance of differences.

### XVIII. REPORT

A comprehensive report will be prepared upon completion of the study. The final report will contain a summary, experimental design and methods, evaluation of the test results, and data and measurements required by this protocol. The report will include the following:

#### A. Text

1. Experimental design
2. Survival data
3. Results of significant daily observations
4. Body weights
5. Necropsy and histopathologic findings
6. Results of parturition and litter observations

1. Estrous cycle determinations (individual)
2. F<sub>0</sub> male and female weekly body weights and survival (summary and individual)
3. Maternal body weights during gestation and lactation (summary, including body weight changes and individual)
4. Gestation and lactation data (summary and individual)
5. Uterine observations at weaning (individual)

C. Appendices

1. Test article data (if available)
2. Dates of Quality Assurance inspections and report of significant deviations from protocol
3. Historical control data

XIX. PERSONNEL HEALTH AND SAFETY

Normal safety precautions will be employed in the handling of the test article, unless otherwise indicated in Section IX.

XX. DATA AND SAMPLE RETENTION

All data, including reports from this study, will be retained for at least 10 years after completion of the study and stored in the IRDC Archives and will be made available for inspection upon request by authorized personnel of the Sponsor.

Tissues preserved in fixative will be retained for at least 5 years in the IRDC Archives. Paraffin embedded blocks and all tissue slides will be retained indefinitely in the IRDC Archives.

XXI. RECORDS TO BE MAINTAINED

- A. Protocol and protocol addenda
- B. Study schedule
- C. Pre-initiation data
- D. Technical personnel list with signatures
- E. Source, purchase order, shipping labels and age records for animals
- F. Sex verification records
- G. Diet lot numbers and contaminant analyses records
- H. Animal identification (ear tag records)
- I. Room humidity and temperature records
- J. General procedures
- K. Scale and balance accuracy verification
- L. Daily observation (room check) records

3011

#### XXI. RECORDS TO BE MAINTAINED (continued)

- M. Weekly detailed observations for pharmacotoxic signs, and general appearance and behavior
- N. Body weight records
- O. Food consumption records
- P. Test article data
- Q. Test article preparation instructions
- R. Test article preparation records
- S. Test article administration records
- T. Date and type of termination for each animal in the study, i.e., spontaneous death, accidental death, sacrificed in extremis (unscheduled sacrifice), or scheduled sacrifice
- U. Necropsy records
- V. Randomization data
- W. Quality Assurance inspections
- X. Drinking water analysis
- Y. Miscellaneous study data

#### XXII. QUALITY ASSURANCE AND GOOD LABORATORY PRACTICES

This nonclinical laboratory study will be conducted in accordance with the Good Laboratory Practice Regulations.

The study will be subjected to periodic inspections, and the final report will be reviewed, by IRDC's Quality Assurance Department in accordance with IRDC's Standard Operating Procedures. Study quality assurance inspection records will be made available to the Sponsor during Sponsor visits to IRDC.

#### XXIII. STATEMENT OF COMPLIANCE

The final report will include a statement signed by the Study Director that the Final Report accurately reflects the raw data obtained during the performance of the study and that there were no significant deviations from the Good Laboratory Practice Regulations which affected the quality or integrity of the study. If deviations are encountered that will affect the quality or integrity of the study, each deviation will be described in detail.

#### XXIV. ALTERATION OF DESIGN

Alterations of this protocol may be made as the study progresses. No changes in the protocol will be made without the specific written request or consent of the Sponsor. In the event that the Sponsor authorizes a protocol change verbally, such change will be honored by IRDC. However, it then becomes the responsibility of the Sponsor to follow such verbal change with a written verification. All protocol modifications will be signed by the Study Director.

30/12

XXV. DECLARATION OF INTENT

This study is intended to support (Sponsor should initial where appropriate):

- A. Registration or notification of a product or chemical by the U.S. Environmental Protection Agency \_\_\_\_\_
- B. Application for research and/or marketing permits for a product regulated by the U.S. Food and Drug Administration \_\_\_\_\_
- C. Neither of the above \_\_\_\_\_

Page 2 of 7

## PRECAUTIONARY MEASURES

Contents packed under water and will ignite if water is removed.  
Do not get in eyes, on skin, on clothing.  
Avoid breathing vapor or fume from burning phosphorus.  
Avoid breathing vapor, mist or dust.  
Keep container closed.  
Use with adequate ventilation.  
Wash thoroughly after handling.

**Drum Disposal:** Emptied container retains vapor and product residue. Observe all labeled safeguards until container is destroyed. DO NOT REUSE THIS CONTAINER. DO NOT CUT OR WELD ON OR NEAR THIS CONTAINER.

**Bulk Container:** The hazardous nature of tank inspection, cleaning, repairs, etc requires trained personnel familiar with the hazards involved. Emptied tank retains vapor and product residue. DO NOT CUT OR WELD ON OR NEAR THIS CONTAINER.

## EMERGENCY AND FIRST AID PROCEDURES

**POISON: CALL A PHYSICIAN.**

**FIRST AID:** IF IN EYES OR ON SKIN, immediately flush with plenty of water for at least 15 minutes and immediately remove contaminated clothing and shoes. Keep skin area wet until medical attention is obtained. Destroy contaminated clothing and shoes.

IF SWALLOWED, induce vomiting immediately by giving two glasses of water and sticking finger down throat. NEVER GIVE ANYTHING BY MOUTH TO AN UNCONSCIOUS PERSON.

IF PHOSPHORUS OR SMOKE AND FUMES FROM BURNING PHOSPHORUS ARE INHALED, remove to fresh air. If not breathing, give artificial respiration, preferably mouth-to-mouth. If breathing is difficult, give oxygen.

IN CASE OF: FIRE, SPILL OR LEAK, cover with water, sand or earth.

## OCCUPATIONAL CONTROL PROCEDURES

**Eye Protection:** When small quantities are handled and may come in contact with air, a shield is recommended. When bulk quantities are being handled, a fire-resistant face shield integrated with a whole head hood is recommended (See Skin Protection). Provide an eye bath where there is potential for eye contact.

**Skin Protection:** Where material is likely to be handled in pure form, fire-resistant apparel should be used. Consult glove and body apparel manufacturer to determine appropriate glove/clothing for your application. Wash immediately if skin is contaminated. Launder contaminated equipment before reuse. Provide a safety shower at any location where skin contact can occur. Wash thoroughly after handling.

**Respiratory Protection:** Avoid breathing dust, vapor or mist. Use NIOSH/MSHA approved equipment when airborne exposure limits are exceeded. Full facepiece equipment is recommended and, if used, replaces need for face shield and/or chemical splash goggles. Consult respirator manufacturer to determine appropriate type equipment for given application. The respirator use limitations specified by NIOSH/MSHA or the manufacturer must be observed. High airborne concentrations may require use of self-contained breathing apparatus or supplied air respirator. Respiratory protection programs must be in compliance with 29 CFR 1910.134.

(Occupational Control Procedures Continued On The Next Page)

# Monsanto MATERIAL SAFETY DATA

## OCCUPATIONAL CONTROL PROCEDURES (Continued)

**Ventilation:** Provide ventilation to control exposure levels below airborne exposure limits. Use local mechanical exhaust ventilation at sources of air contamination such as open process equipment. Consult NFPA Standard 91 for design of exhaust systems.

**Airborne Exposure Limits:** Product: Phosphorus

OSHA PEL: 0.1 mg/m<sup>3</sup> 8-hour time-weighted average  
 ACGIH TLV: 0.1 mg/m<sup>3</sup> 8-hour time-weighted average  
 0.3 mg/m<sup>3</sup> short-term exposure limit - 1985-86 Proposed Deletion

**Note:** In light of a recent reproductive study in rats that demonstrated difficulty in delivery for some female rats, Monsanto has adopted an internal restriction for pregnant females where exposure exceeds 0.01 mg/m<sup>3</sup> 8-hour time-weighted average. Monsanto considers this a prudent and responsible precaution until further studies are performed and evaluated.

## FIRE PROTECTION INFORMATION

Waxy solid

**Melting Point:** 111°F

**Ignition Temperature:** Ignites spontaneously on contact with air. Explosive when mixed with oxidizing materials.

**Extinguishing Media:** Fire can be controlled by carefully covering, avoid splashing with water, moist sand or dirt to exclude air. Apply cold water spray to freeze the liquid and stop leaks.

**Special Fire Fighting Procedures:** Fire fighters and others who may be exposed to products of combustion should wear full protective clothing and self-contained breathing apparatus. Fire fighting equipment should be thoroughly decontaminated after use.

**Unusual Fire or Explosion Hazards:** If intense fire melts tank insulation, there is risk of explosion from steam or phosphoric vapor pressure. If cooling cannot be applied, either vent the tank or evacuate the area. Burning produces dense white irritating fumes of phosphorus pentoxide and H<sub>3</sub>PO<sub>4</sub>.

## REACTIVITY DATA

**Materials to Avoid:** Avoid contact with air (ignites spontaneously on exposure), oxidizing agents, strong bases or basic solutions.

**Hazardous Decomposition Products:** On combustion, releases dense, white, irritating fumes of P<sub>2</sub>O<sub>5</sub> or, if moisture is present, H<sub>3</sub>PO<sub>4</sub>. With strong bases, releases highly toxic and spontaneously ignitable phosphine (PH<sub>3</sub>) gas.

**Hazardous Polymerization:** Above about 200°C (392°F), polymerizes exothermically to red phosphorus. May then heat uncontrollably to develop vapor pressure above tank bursting pressure.

# Monsanto MATERIAL SAFETY DATA

## HEALTH EFFECTS SUMMARY

Page 4 of 7

The following information presents both human experience and the results of scientific experiments used by qualified experts to assess the effects of phosphorus on the health of industrially exposed individuals and to support the Precautionary Statements and Occupational Control Procedures recommended in this document. To avoid misunderstanding, the data provided in this section should be interpreted by individuals trained in evaluation of this type of information.

Dermal contact and inhalation are expected to be the primary routes of occupational exposure to phosphorus. Phosphorus can be absorbed through the skin, respiratory tract and gastrointestinal tract. Phosphorus ignites and burns spontaneously when exposed to air and the vapor produced is irritating to the eyes, nose, throat and lungs. The solid in contact with the skin or eyes produces severe burns. Phosphorus fume is an irritant to the respiratory tract and eyes.

The acute lethal oral dose of phosphorus for an adult is reported to be about 1 mg/kg, with adverse effects reported at 0.1 mg/kg. Acute oral phosphorus intoxication is usually described as having two stages. In the initial phase, gastrointestinal effects, characterized by nausea, vomiting, belching, and severe abdominal pain predominate. Death from cardiovascular collapse can occur in about 12 hours or symptoms may regress with an apparent recovery lasting approximately two days. The second phase may be characterized by return of gastrointestinal distress with signs of hepatic, cardiovascular and renal involvement, including jaundice, oliguria, pitting edema, increased pulse rate, low blood pressure, and coma.

Early signs of chronic systemic intoxication by phosphorus are reported to include anemia, loss of appetite, gastrointestinal distress, chronic cough, a phosphorus garlic-like odor of the breath, and pallor. A common response to severe chronic poisoning is necrosis of the mandible or maxilla (jawbone), known as "phossy jaw." The first indications of "phossy jaw" are toothache and excessive salivation, followed by loosening of teeth, severe pain, and swelling of the jaw. Ulcerations can develop which may invade the bone.

### Toxicological Data

Data from Monsanto studies and from the scientific literature indicate the following:

Oral LD<sub>50</sub> (Male Rat): 3.76 mg/kg, Highly Toxic

Oral LD<sub>50</sub> (Female Rat): 3.03 mg/kg, Highly Toxic

Oral LD<sub>50</sub> (Male Mice): 4.85 mg/kg, Highly Toxic

Oral LD<sub>50</sub> (Female Mice): 4.82 mg/kg, Highly Toxic

Bone changes were reported in female rats (23 days old) given phosphorus at a dietary level of 1.30 mg/kg/day for 8 or 16 days. In the animals treated for 16 days, the bone changes were reversed following withdrawal of the test diet.

Depressed growth was reported in a 22-week feeding study in young female rats fed diets containing phosphorus at median daily dosage levels of 0.0032, 0.018, and 0.072 mg/kg/day. A recovery in growth occurred at the mid-dose level following withdrawal of phosphorus from the diet; no recovery in growth was reported at the high-dose level. Old male rats fed diets containing 0.0027 mg/kg/day displayed no overt effects. Pathology and bone studies were not performed.

In a subchronic toxicity study, female dogs were injected subcutaneously with 0.1, 0.2 or 0.4 mg phosphorus/kg/day. Mortality resulted within 6 days in animals given 0.4 mg/kg. The one animal given 0.2 mg/kg developed severe kidney hemorrhage and died by day 12. Fatty livers, hydropic degeneration in the kidneys, body weight loss, and changes in blood chemistry parameters were reported in dogs surviving treatment with 0.1 mg/kg/day for 116 days.

Retardation of longitudinal bone growth and body weight gain were reported in rabbits orally given 0.6 mg phosphorus/day, via capsule, for periods of 13 to 117 days. Similar effects were noted in rats treated for 22 to 57 days with cod liver oil containing 0.1% phosphorus mixed in the diet. Disturbance of dentin calcification in the teeth of rats was also reported.

(Health Effects Summary Continued On The Next Page)

# Monsanto MATERIAL SAFETY DATA

367  
Page 5 of 7

## HEALTH EFFECTS SUMMARY (Continued)

Phosphorus was administered to rats by subcutaneous injection of oil solutions at dosages ranging from 0.05 to 3.2 mg/kg/day twice weekly for periods up to 610 days. Guinea pigs were injected subcutaneously with similar solutions at dosages of 0.05 to 0.4 mg/kg/day twice weekly for up to 720 days. In the rats, mortality was reported to increase with increasing dosage. Bone pathology (reported to be more marked in rats than in guinea pigs) was observed in an apparent dose-related fashion. Less conspicuous bone changes were noted in rats fed diets containing phosphorus in peanut oil at dosages of 0.2 to 16 mg/kg/day for 174 to 512 days. Mortality was reported to increase in these rats with increase in the total amount of phosphorus administered. The decreased growth rate observed in rats fed phosphorus in the diet was attributed to decreased food consumption.

Phosphorus in corn oil was administered by gavage to female rats at dosages of 0, 0.1, 0.3 or 0.75 mg/kg/day on days 6 through 19 of gestation. A second, satellite study was conducted in which rats received either 0.6 mg phosphorus/kg/day in corn oil or corn oil (control) on a comparable regimen. Due to significant maternal mortality (84%) at 0.75 mg/kg, no fetal evaluations were performed at this dosage. Decreased mean body weights were noted in surviving dams at 0.75 mg/kg. No teratogenic or fetotoxic effects were observed at dosages of 0.6 mg/kg or less. Mortality and decreased mean body weight gain were noted in dams at 0.6 mg/kg.

Administration of phosphorus in corn oil to male and female rats by gavage at doses of 0.005, 0.015, and 0.075 mg/kg/day throughout pre mating, mating, gestation, and lactation periods for one generation resulted in increased mortality among females of the high dose group during day 21 or 22 of gestation after both the F<sub>1a</sub> and F<sub>1b</sub> matings. This observation suggests that deaths may have been related to difficulties in delivering. A reduction in the mean number of live pups was also observed at the highest dose. No pathologic or histopathologic lesions were reported in either parental animals or pups. The no-observable effect level was considered to be 0.015 mg/kg/day.

Following administration of single oral doses (0.3 mg/kg) of phosphorus to rats, elimination of phosphorus or its metabolites was reported to occur primarily in urine and feces. Approximately 46.7% and 33% of the absorbed radioactivity was excreted in the urine and feces, respectively, of rats within five days. Increases in total body burden were noted in rats dosed for five consecutive days compared to rats dosed once.

### Additional Information

A Threshold Limit Value (TLV) has been established by the American Conference of Governmental Industrial Hygienists for phosphorus (P<sub>4</sub>). For further information on this material, please refer to the current edition of the *Documentation of Threshold Values*.

Based on results of the one-generation reproduction study (discussed above), which reported adverse effects on pregnant rodents at the time of delivery, Monsanto considers it prudent to review job situations involving the handling and use of P<sub>4</sub> for possible restrictions for pregnant female workers. Work situations are evaluated within Monsanto to determine the extent of routine exposures, and the potential for accidental exposures, to phosphorus. Pregnant females will be restricted from areas where exposures are deemed significant (greater than 0.01 mg/m<sup>3</sup> 8-hour time weighted average or where there is a significant potential for accidental exposure). This restriction will apply as soon as pregnancy is confirmed. Since the animal data suggest a potential for adverse effects during delivery, this restriction remains in effect for the pregnant female until after delivery.

## PHYSICAL DATA

<b>Appearance:</b>	Waxy solid, normally pale yellow to straw-colored
<b>Odor:</b>	Mildly characteristic (phossy); fumes from burning phosphorus are pungent and sharp
<b>Melting Point:</b>	44.1°C (111°F)

(Physical Data Continued On The Next Page)

# Monsanto MATERIAL SAFETY

## PHYSICAL DATA (Continued)

**Boiling Point:** 280.5°C (536.9°F)

**Vapor Density (Air = 1):** 4.42

**Specific Gravity @ 20°C (68°F):** 1.8231  
@ 25°C (77°F): 1.8198  
@ 50°C (122°F): 1.737

**Solubility in Water @ 20°C (68°F):** 0.003%

**Note:** These physical data are typical values based on material tested but may vary from sample to sample. Typical values should not be construed as a guaranteed analysis of any specific lot or as specification items.

## EMERGENCY SPILL AND LEAK INFORMATION

### **Emergency Spill and**

**Leak Information:** When released to the environment in quantities equal to or exceeding one pound (0.454 kilograms), phosphorus is defined as a *hazardous substance* in the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (Superfund) and in the current federal regulations 40 CFR, Part 116 (Section 311, Clean Water Act). As a result, notification of such a release is required to be made to the National Response Center (800-424-8802).

Contain all spilled material (i.e., earthen dike, sand, etc.) and apply a low pressure, cold water spray to extinguish fire and freeze contents. Continue applying water spray to prevent reignition and maintain water cover.

**Disposal Information:** Dispose of in accordance with all local, state, and federal regulations.

As currently defined in federal Resource Conservation & Recovery Act (RCRA) regulations, phosphorus, when discarded, is a hazardous waste exhibiting the characteristics of ignitability (D-001). See 40 CFR 261.21. Its disposal, therefore, is regulated under RCRA regulations. Elemental phosphorus manufacturing facilities are currently exempt from RCRA regulations by 40 CFR 261.4(b)(7).

Disposal by incineration is recommended.

Consult your attorney or appropriate regulatory officials for information regarding spill, leak, and waste disposal requirements.

## ADDITIONAL COMMENTS

### Environmental Toxicity Information

Phosphorus is highly toxic to fish. The 48 to 96 hour LC<sub>50</sub> for a variety of fish and invertebrates is less than 1 ppm. For additional data, the reader is referred to the National Technical Information Service (NTIS) publication "Mammalian Toxicology and Toxicity to Aquatic Organisms of Four Important Types of Waterborne Munitions Pollutants," March 1974, Technical Report 7403.

Monsanto Chemical Company  
800 N. Lindbergh Boulevard  
St. Louis, Missouri 63167  
Phone: (314) 694-1000

September 5, 1989

Dear (Customer):

An industry consortium led by Monsanto recently completed the in-life portion of a reproductive effects study on elemental phosphorus, also known as white or yellow phosphorus. In this study rats were given the test material by gavage, i.e. dosed by stomach tube with phosphorus dissolved in a solvent. Dosing took place daily for 100 days prior to mating, throughout mating, and either through day 15 of gestation or throughout gestation. Preliminary results show the occurrence of deaths in treated female rats during the last two days of gestation and during the birthing process. The incidence of deaths was similar in the groups of rats whether dosed just through day 15 or throughout the entire gestation period.

These results indicate that stopping the dosing in rats at a time corresponding approximately to the end of the first trimester in humans still led to deaths. Accordingly Monsanto is changing its internal workplace protective measures for female employees.

Our past practice, as outlined on our MSDS dated 5/1/86, was to exclude pregnant female employees from areas in our plants where airborne elemental phosphorus concentrations might exceed  $0.01 \text{ mg/m}^3$ . Our new practice is to exclude women of childbearing potential from workplace areas where airborne concentration may exceed  $0.01 \text{ mg/m}^3$ . Assuming all inhaled phosphorus were absorbed during an 8-hour workday at  $0.01 \text{ mg/m}^3$ , the dose to a pregnant female would be less than that administered to rats. Thus there is still an adequate margin of safety at this airborne concentration and the protective measures are conservative and prudent. A copy of our revised MSDS dated 9/1/89 is enclosed for your files. Please discard the previous MSDS.

The test results were judged to meet EPA's reporting criteria under Section 8(e) of TSCA. Therefore, Monsanto, on behalf of the industry consortium,

3/0

Page 2

submitted a summary of these results to the Agency. A copy of the letter and attachment is enclosed for your reference. If you have questions regarding the test results, the change in Monsanto's workplace protective measures or the submission to EPA, please contact me.

Sincerely,

James P. Mieure, Ph.D.  
Manager, Product Safety

## HEALTH EFFECTS SUMMARY

---

The following information summarizes human experience and the results of scientific investigations reviewed by health professionals for hazard evaluation of phosphorus and development of Precautionary Statements and Occupational Control Procedures recommended in this document.

### Effects of Exposure

Dermal contact and inhalation are expected to be the primary routes of occupational exposure to phosphorus. Phosphorus can be absorbed through the skin, respiratory tract and gastrointestinal tract. Phosphorus ignites and burns spontaneously when exposed to air and the vapor produced is irritating to the eyes, nose, throat and lungs. The solid in contact with the skin or eyes produces severe burns. Phosphorus fume is an irritant to the respiratory tract and eyes.

The acute lethal oral dose of phosphorus for an adult is reported to be about 1 mg/kg, with adverse effects reported at 0.1 mg/kg. Acute oral phosphorus intoxication is usually described as having two stages. In the initial phase, gastrointestinal effects, characterized by nausea, vomiting, belching, and severe abdominal pain predominate. Death from cardiovascular collapse can occur in about 12 hours or symptoms may regress with an apparent recovery lasting approximately two days. The second phase may be characterized by return of gastrointestinal distress with signs of hepatic, cardiovascular and renal involvement, including jaundice, oliguria, pitting edema, increased pulse rate, low blood pressure, and coma.

Early signs of chronic systemic intoxication by phosphorus are reported to include anemia, loss of appetite, gastrointestinal distress, chronic cough, a phosphorus garlic-like odor of the breath, and pallor. A common response to severe chronic poisoning is necrosis of the mandible or maxilla (jawbone), known as "phossy jaw." The first indications of "phossy jaw" are toothache and excessive salivation, followed by loosening of teeth, severe pain, and swelling of the jaw. Ulcerations can develop which may invade the bone.

Although no data are available on the effects of phosphorus in pregnant women, this material was reported to produce a high incidence of deaths in experimental animals during late pregnancy and delivery. Workplace controls for phosphorus exposure may be necessary to prevent significant exposures to women of child-bearing potential.

### Toxicological Data

Data from Monsanto studies and from the scientific literature indicate the following:

Oral LD<sub>50</sub> (Male Rat): 3.76 mg/kg, Highly Toxic  
Oral LD<sub>50</sub> (Female Rat): 3.03 mg/kg, Highly Toxic  
Oral LD<sub>50</sub> (Male Mice): 4.85 mg/kg, Highly Toxic  
Oral LD<sub>50</sub> (Female Mice): 4.82 mg/kg, Highly Toxic

Bone changes were reported in female rats (23 days old) given phosphorus at a dietary level of 1.30 mg/kg/day for 8 or 16 days. In the animals treated for 16 days, the bone changes were reversed following withdrawal of the test diet.

Depressed growth was reported in a 22-week feeding study in young female rats fed diets containing phosphorus at median daily dosage levels of 0.0032, 0.018, and 0.072 mg/kg/day. A recovery in growth occurred at the mid-dose level following withdrawal of phosphorus from the diet; no recovery in growth was reported at the high-dose level. Old male rats fed diets containing 0.0027 mg/kg/day displayed no overt effects. Pathology and bone studies were not performed.

### **HEALTH EFFECTS SUMMARY - CONTINUED**

---

In a subchronic toxicity study, female dogs were injected subcutaneously with 0.1, 0.2 or 0.4 mg phosphorus/kg/day. Mortality resulted within 6 days in animals given 0.4 mg/kg. The one animal given 0.2 mg/kg developed severe kidney hemorrhage and died by day 12. Fatty livers, hydroptic degeneration in the kidneys, body weight loss, and changes in blood chemistry parameters were reported in dogs surviving treatment with 0.1 mg/kg/day for 116 days.

Retardation of longitudinal bone growth and body weight gain were reported in rabbits orally given 0.6 mg phosphorus/day, via capsule, for periods of 13 to 117 days. Similar effects were noted in rats treated for 22 to 57 days with cod liver oil containing 0.1% phosphorus mixed in the diet. Disturbance of dentin calcification in the teeth of rats was also reported.

Phosphorus was administered to rats by subcutaneous injection of oil solutions at dosages ranging from 0.05 to 3.2 mg/kg/day twice weekly for periods up to 610 days. Guinea pigs were injected subcutaneously with similar solutions at dosages of 0.05 to 0.4 mg/kg/day twice weekly for up to 720 days. In the rats, mortality was reported to increase with increasing dosage. Bone pathology (reported to be more marked in rats than in guinea pigs) was observed in an apparent dose-related fashion. Less conspicuous bone changes were noted in rats fed diets containing phosphorus in peanut oil at dosages of 0.2 to 16 mg/kg/day for 174 to 512 days. Mortality was reported to increase in these rats with increase in the total amount of phosphorus administered. The decreased growth rate observed in rats fed phosphorus in the diet was attributed to decreased food consumption.

Phosphorus in corn oil was administered by gavage to female rats at dosages of 0, 0.1, 0.3 or 0.75 mg/kg/day on days 6 through 19 of gestation. A second, satellite study was conducted in which rats received either 0.6 mg phosphorus/kg/day in corn oil or corn oil (control) on a comparable regimen. Due to significant maternal mortality (84%) at 0.75 mg/kg, no fetal evaluations were performed at this dosage. Decreased mean body weights were noted in surviving dams at 0.75 mg/kg. No teratogenic or fetotoxic effects were observed at dosages of 0.6 mg/kg or less. Mortality and decreased mean body weight gain were noted in dams at 0.6 mg/kg.

Administration of phosphorus in corn oil to male and female rats by gavage at doses of 0.005, 0.015, and 0.075 mg/kg/day throughout pre mating, mating, gestation, and lactation periods for one generation resulted in increased mortality among females of the high dose group during day 21 or 22 of gestation after both the F1a and F1b matings. This observation suggests that deaths may have been related to difficulties in delivering. A reduction in the mean number of live pups was also observed at the highest dose. No pathologic or histopathologic lesions were reported in either parental animals or pups. The no-observable effect level was considered to be 0.015 mg/kg/day. A similar study was conducted at a single dose level of 0.075 mg/kg/day as a follow up to the earlier reproduction study. Preliminary results confirm earlier findings in that death in females was increased during late pregnancy and delivery. Death was also increased in female rats dosed only through day 15 of pregnancy.

Following administration of single oral doses (0.3 mg/kg) of phosphorus to rats, elimination of phosphorus or its metabolites was reported to occur primarily in urine and feces. Approximately 46.7% and 33% of the absorbed radioactivity was excreted in the urine and feces, respectively, of rats within five days. Increases in total body burden were noted in rats dosed for five consecutive days compared to rats dosed once.

**Additional Information**

Two reproduction studies with phosphorus in experimental animals reported increased deaths late in pregnancy and during delivery. As a result of these effects reported in experimental animals, Monsanto considers it prudent to review job situations involving the handling and use of phosphorus for possible restrictions for pregnant female workers. Work situations are evaluated within Monsanto to determine the extent of routine exposures, and the potential for accidental exposures, to phosphorus. Women of child-bearing potential will be restricted from areas where exposures are deemed significant (greater than 0.01 mg/m<sup>3</sup> 8-hour time-weighted average or where there is a high potential for accidental exposure).

**HEALTH EFFECTS SUMMARY - CONTINUED**

---

A Threshold Limit Value (TLV) has been established by the American Conference of Governmental Industrial Hygienists for phosphorus (P4). For further information on this material, please refer to the current edition of the Documentation of the Threshold Values and Biological Indices.

---

**PHYSICAL DATA**

---

**Appearance:** Waxy solid, normally pale yellow to straw-colored

**Odor:** Mildly characteristic (phossey); fumes from burning phosphorus are pungent and sharp

**Melting Point:** 44.1°C (111°F)

**Boiling Point:** 280.5°C (536.9°F)

**Vapor Density (Air = 1):** 4.42

**Specific Gravity @ 20°C (68°F):** 1.8231  
@ 25°C (77°F): 1.8198  
@ 50°C (122°F): 1.737

**Solubility in Water @ 20°C (68°F):** 0.003%

**NOTE:** These physical data are typical values based on material tested but may vary from sample to sample. Typical values should not be construed as a guaranteed analysis of any specific lot or as specification items.

---

**SPILL, LEAK & DISPOSAL INFORMATION**

---

**Emergency Spill and Leak Information:** When released to the environment in quantities equal to or exceeding one pound (0.454 kilograms), phosphorus is defined as a hazardous substance in the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (Superfund) and in the current federal regulations 40 CFR, Part 116 (Section 311, Clean Water Act). As a result, notification of such a release is required to be made to the National Response Center (800-424-8802).

Contain all spilled material (i.e., earthen dike, sand, etc.) and apply a low pressure, cold water spray to extinguish fire and freeze contents. Continue applying water spray to prevent reignition and maintain water cover.

**Disposal Information:** Dispose of in accordance with all local, state, and federal regulations.

As currently defined in federal Resource Conservation & Recovery Act (RCRA) regulations, phosphorus, when discarded, is a hazardous waste exhibiting the characteristics of Ignitability (D-001). See 40 CFR 261.21. Its disposal, therefore, is regulated federal RCRA regulations. Elemental phosphorus manufacturing facilities are currently exempt from RCRA regulations by 40 CFR 261.4(b)(7).

**Disposal by incineration is recommended.**

Consult your attorney or appropriate regulatory officials for information regarding spill, leak, and waste disposal requirements.

---

**ADDITIONAL COMMENTS**

---

**Environmental Toxicity Information**

Phosphorus is highly toxic to fish. The 48 to 96 hour LC50 for a variety of fish and invertebrates is less than 1 ppm. For additional data, the reader is referred to the National Technical Information Service (NTIS) publication "Mammalian Toxicology and Toxicity to Aquatic Organisms of Four Important Types of Waterborne Munitions Pollutants," March 1974, Technical Report 7403.
