

The following figures show statistical summaries (median, 95% confidence interval) of the posterior uncertainty distributions of the “scaling” (sampled) mouse PBPK model parameters for the population mean (labeled “M,” using “+” symbol and thick error bar) and specific groups (labeled by number, using “o” symbol and thin error bar). The population mean distributions were also tabulated in Table A-9. In addition, for each parameter (abbreviations in Table A-4), the horizontal lines represents the median (thick gray line) and 95% confidence interval (thin dashed line) of the population distribution for combined uncertainty and variability. The numbers denoting the ten mouse groups correspond to the following data:

1. Abbas and Fisher (1997), Abbas et al. (1997);
2. Fisher et al. (1991) females;
3. Fisher et al. (1991) males;
4. Fisher and Allen (1993) females;
5. Fisher and Allen (1993) males;
6. Green and Prout (1985), Prout et al. (1985);
7. Greenberg et al. (1999);
8. Larson and Bull (1992a, b);
9. Merdink et al. (1998);
10. Templin et al. (1993)
